an_shchitov@rambler.ru

Keywords: best approximations, Jackson-type inequality, trigonometric polynomials, sharp constant, modulus of continuity, $S^p$ spaces, $L_2$ space.

Abstract. We find the sharp constant in the Jackson-type inequality between the value of the best approximation of functions by trigonometric polynomials and moduli of continuity of $m$-th order in the spaces $S^p$, $1 \leq p < \infty$. In the particular case we obtain one result which in a certain sense generalizes the result obtained by L.V. Taykov for $m = 1$ in the space $L_2$ for the arbitrary moduli of continuity of $m$-th order ($m \in \mathbb{N}$).

Introduction

Trigonometric polynomials are the object of the study for a long time. The significant results in the approximation theory were obtained by Jackson. He proved that for an arbitrary $2\pi$-periodic continuous function the following inequality holds

$$E_{n-1}(f)_C \leq K\omega(f; \frac{1}{n}) ,$$

where

$$E_{n-1}(f)_C = \inf \left\{ \| f - T_{n-1} \|_C : T_{n-1} \in T_{n-1} \right\}$$

is the value of the best approximation of function $f$ by the subspace $T_{n-1}$ of trigonometric polynomials of degree $n - 1$ in the continuous metric;

$$\omega(f; t) = \sup \left\{ \| f(\cdot + h) - f(\cdot) \|_C : |h| \leq t \right\}$$

is the modulus of continuity of function $f$, and $K$ is a constant which doesn’t depend on $n$ and $f$. This inequality and analogous relations are known in the approximation theory as the Jackson-type inequalities. In approximation theory it is of importance to find the smallest constant from all possible ones in the Jackson-type inequalities. Such constants are called the sharp constants.

The questions of the obtaining the Jackson-type inequalities in case of approximation by trigonometric polynomials in the uniform and integral metrics were studied by many mathematicians, see for example the articles [1]-[25].

A.I. Stepanets in [26] introduced the normed spaces $S^p$ ($1 \leq p < \infty$) of the integrable functions $f(x)$ having the period $2\pi$ for which

$$\| f \|_{S^p} \overset{df}{=} \left\{ \sum_{k \in \mathbb{Z}} |\hat{f}(k)|^p \right\}^{1/p} < \infty ,$$

where

$$\hat{f}(k) = (2\pi)^{-1/2} \int_{-\pi}^{\pi} f(x)e^{-ikx}dx$$ (1)

are the Fourier coefficients of the function $f(x)$ on the trigonometric system $(2\pi)^{-1/2}e^{ikx}, k \in \mathbb{Z}$. It was proved that the spaces $S^p$ ($1 \leq p < \infty$) have the substantial properties of the Hilbert spaces, i.e. the minimal property of the partial Fourier sums. If

$$E_{n-1}(f)_{S^p} \overset{df}{=} \inf \left\{ \| f - T_{n-1} \|_{S^p} : T_{n-1} \in T_{n-1} \right\}$$
is the value of the best approximation of function \( f(x) \in S^p \) by the subspace \( T_{n-1} \) of trigonometric polynomials of degree \( n - 1 \) in the metric of the space \( S^p \) then

\[
E_{n-1}(f)_{S^p} = \|f - s_{n-1}(f)\|_{S^p} = \left\{ \sum_{|k| \geq n} |\hat{f}(k)|^p \right\}^{1/p},
\]

(2)

where

\[
s_{n-1}(f, x) = (2\pi)^{-1/2} \sum_{|k| \leq n-1} \hat{f}(k) e^{ikx}
\]
is the partial sum of the Fourier series

\[
s(f, x) = (2\pi)^{-1/2} \sum_{k \in \mathbb{Z}} \hat{f}(k) e^{ikx}
\]
of function \( f(x) \in S^p \).

A.I. Stepanets stated in [26] that for \( p = 2 \) it is hold the equality

\[
\|f\|_{L^2} = \|f\|_{S^2}.
\]

Let

\[
\omega_m(f, t)_X = \sup \left\{ \|\Delta_h^m f(\cdot)\|_X : 0 < h \leq t \right\},
\]
is a modulus of continuity of order \( m \) of the function \( f(x) \in X \), where

\[
\Delta_h^m f(x) = \sum_{j=0}^{m} (-1)^{m-j} \binom{m}{j} f(x + jh)
\]
is a finite difference of order \( m \) of the function \( f(x) \) at the point \( x \) with the step \( h \). If \( X = L_p \) (\( 1 \leq p < \infty \)) then the value \( \omega_m(f, t)_{L_p} \) is the known integral modulus of continuity [27]. In case of \( X = S^p \) the modulus of continuity \( \omega_m(f, t)_{S^p} \) was introduced in the article [28].

Let \( \Psi(k) \) and \( \beta(k) \overset{df}{=} \beta_k \) \((k \in \mathbb{N})\) are the constrictions on \( \mathbb{N} \) of the arbitrary functions \( \Psi(x) \) and \( \beta(x) \) defined on the half-segment \([1, \infty)\). Let’s suppose that the series

\[
\sum_{k=1}^{\infty} \frac{1}{\Psi(k)} \left( a_k(f) \cos \left(kx + \frac{\beta_k \pi}{2}\right) + b_k(f) \sin \left(kx + \frac{\beta_k \pi}{2}\right) \right)
\]
is the Fourier series of some summable function which we denote by \( f^\Psi_p(x) \) according to [29]. The function \( f^\Psi_p(x) \) is called \( (\Psi, \beta) \)-derivative of the function \( f(x) \). The concept of the \( (\Psi, \beta) \)-derivative is the generalization of the definition of the \( r \)-th derivative of function. When \( \Psi(k) = k^{-r} \) (\( 0 < r < \infty \)) and \( \beta(k) = r \) then the \( r \)-th derivative of the function \( f(x) \) differs from the \( (k-r, r) \)-derivative only on the constant value.

Let \( L^\Psi_p(S^p) \) is the set of integrable functions \( f(x) \) having the period \( 2\pi \) which have the \( (\Psi, \beta) \)-derivatives. Also let \( L^\Psi_p(S^p) \) is the set of the functions \( f(x) \in L^\Psi_p \) such that their \( (\Psi, \beta) \)-derivatives belong to the space \( S^p \). If \( \Psi(k) = k^{-r} \) (\( 0 < r < \infty \)) and \( \beta(k) = r \) then we use notation \( L^r(S^p) \); \( L^r_2 \equiv L^r(S^2) \).

A lot of articles are devoted to solving problems of approximation theory in the spaces \( S^p \) \((1 \leq p < \infty)\). For example, in the articles [30]-[36] were studied the approximation properties of trigonometric system and were solved several problems on obtaining the Jackson-type inequalities

\[
E_{n-1}(f)_{S^p} \leq \chi(t) \cdot n^{-r} \omega_m(f^{(r)}, \frac{t}{n})_{S^p} \quad (t > 0)
\]

and finding the sharp constants for the fixed values of \( m, n, t \) and \( p \), that is the values
\[
\chi_{n,m}(t)_{S^p} = \sup \left\{ \frac{E_{n-1}(f)_{S^p}}{\omega_m(f, \frac{t}{n})_{S^p}} : f \in L^r(S^p), f \neq \text{const} \right\} (t > 0).
\]

We assume that the ratio 0/0 is equal to zero.

Let’s define the following notation

\[
\chi_{n,(\Psi,\beta),m,p,r}(F, t, S^p) \overset{df}{=} \sup_{f(x) \in L^r_{\Psi} (S^p)} \left( \frac{\int_0^t \omega_m(f_{\beta}^{\Psi} x, S^p) F(x) dx}{n^{-p} E_{n-1}(f)_{S^p}} \right)^{1/p}.
\]

In the spaces \( S^p \) the values of the type (4) were studied by A.I. Stepanets, A.S. Serduk [28] \( \chi_{n,(1,0),m,p,1/p}(F, \frac{t}{n}; S^p), F(x) = \sin(n x) \), A.S. Serduk [31] \( \chi_{n,(\Psi, r),m,p,1}(F, \frac{t}{n}; S^p), F(x) = \sin(n x) \); \( \chi_{n,(\Psi, r),m,p,1}(F, t; S^p), F(x) \equiv 1, 0 < t \leq \frac{3\pi}{4} \), S.B. Vakarchuk [33] \( \chi_{n,(\Psi, \beta),m,p,0}(F, t; S^p), F(x) \equiv 1, 0 < t \leq \frac{\pi}{n} \). The analogous to (4) values were considered by B.P. Voychihivskiy [34], S.B.Vakarchuk and A.N.Shchitov [35].

In the article [35] were obtained the exact values of extremal characteristics of a special form between the values of best polynomial approximations of functions \( E_{n-1}(f)_{S^p} \) and moduli of continuity of \( m \)-th order \( \omega_m(f_{\beta}^{\Psi}, t)_{S^p} \). The asymptotically sharp inequalities of Jackson type between the values \( E_{n-1}(f)_{S^p} \) and moduli of continuity of functions \( f(x) \in S^p \) were found in the article [35].

The aim of the current study is the obtaining of the sharp constant in the Jackson-type inequality between the value of the best approximation of functions from the class \( L^p_{\Psi}(S^p) \) by trigonometric polynomials \( E_{n-1}(f)_{S^p} \) and moduli of continuity of \( m \)-th order \( \omega_m(f_{\beta}^{\Psi} t)_{S^p} \) in the spaces \( S^p, 1 < p < \infty \).

**Sharp constant in the Jackson-type inequality for the best approximation of functions** \( f(x) \in S^p \)

Further we suppose that the function \( \Psi(x) (1 \leq x < \infty) \) is the positive function which monotonically decreases to zero with increasing of \( x \).

Sharp constant in the Jackson-type inequality for the best \( S^p \)-approximation of functions by trigonometric polynomials is found in the next theorem.

**Theorem 1.** For the arbitrary numbers \( n, m \in \mathbb{N}, 0 < \tau \leq \frac{3\pi}{4n} \) and \( 1 \leq p < \infty \) the following equality holds

\[
\sup_{f(x) \in L^r_{\Psi}(S^p)} \left\{ \frac{\int_0^\pi \omega_m^{2/m} (f_{\beta}^{\Psi} h, S^p) dh}{2(n\tau - \sin n\tau)} \right\}^{m/2} = \Psi(n) \left\{ \frac{n}{2(n\tau - \sin n\tau)} \right\}^{m/2}.
\]

**Proof.** Using following

\[
a_k(f) = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \cos k x dx;
\]

\[
b_k(f) = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \sin k x dx (k \in \mathbb{Z}_+),
\]

we can write the Fourier coefficients (1) in the form

\[
\hat{f}(k) = \left( \frac{\pi}{2} \right)^{1/2} (a_k(f) - ib_k(f) \text{sgn } k) (k \in \mathbb{Z}).
\]
Then the relation (2) can be written in the next form

\[ E_{n-1}(f)_{S^p} = \left( \frac{\pi}{2} \right)^{1/2} \left\{ 2 \sum_{k=n}^{\infty} \rho_k^p(f) \right\}^{1/p}, \tag{7} \]

where

\[ \rho_k(f) \xrightarrow{df} \sqrt{a_k^2(f) + b_k^2(f)}. \]

It is known [29] that Fourier coefficients of the functions \( f(x) \) and \( f^\Psi_{\pi}(x) \) are connected by the formula

\[
\begin{align*}
    a_k(f) &= \Psi(k) \left( a_k(f^\Psi_{\pi}) \cos \frac{\beta_k \pi}{2} - b_k(f^\Psi_{\pi}) \sin \frac{\beta_k \pi}{2} \right), \\
    b_k(f) &= \Psi(k) \left( a_k(f^\Psi_{\pi}) \sin \frac{\beta_k \pi}{2} + b_k(f^\Psi_{\pi}) \cos \frac{\beta_k \pi}{2} \right). 
\end{align*} \tag{8} \]

From (6) and (8) we have

\[
\hat{f}(k) = e^{-i \beta_k \pi \text{sgn}(k)/2} \Psi(|k|) \hat{f}^\Psi_{\pi}(k) \quad (k \in \mathbb{Z} \backslash \{0\}). \tag{9} \]

In the article [28] it was shown that for an arbitrary function \( f(x) \in S^p \) (1 \( \leq p < \infty \))

\[
\| \Delta^m_h f(\cdot) \|_{S^p}^p = 2^{mp/2} \sum_{k \in \mathbb{Z}} |\hat{f}(k)|^p (1 - \cos kh)^{mp/2}. \tag{10} \]

Using (6) and (10) we write

\[
\| \Delta^m_h f^\Psi_{\pi}(\cdot) \|_{S^p}^p = \pi^{p/2} 2^{1+(m-1)p/2} \sum_{k=1}^{\infty} \rho_k^p(f^\Psi_{\pi})(1 - \cos kh)^{mp/2}. \tag{11} \]

From the (9) it immediately follows the equation

\[ \rho_k(f) = \Psi(k) \rho_k(f^\Psi_{\pi}). \]

Then using the last equation from the (11) we have

\[
\| \Delta^m_h f^\Psi_{\pi}(\cdot) \|_{S^p}^p = \pi^{p/2} 2^{1+(m-1)p/2} \sum_{k=1}^{\infty} \frac{1}{\Psi_p(k)} \rho_k^p(f)(1 - \cos kh)^{mp/2}. \tag{12} \]

Using (7) we can write

\[
E_{n-1}^p(f)_{S^p} = \left( \frac{\pi}{2} \right)^{p/2} 2 \sum_{k=n}^{\infty} \rho_k^p(f) \cos kh = \left( \frac{\pi}{2} \right)^{p/2} 2 \sum_{k=n}^{\infty} \rho_{k}^{p-2/m}(f) \rho_k^{2/m}(f)(1 - \cos kh). \tag{13} \]

Applying the Holder’s inequality to the right part of the (13), using (2), (12), definition of the modulus of continuity of the \( m \)-th order and the decreasing character of the function \( \Psi(x) \), from the (13) we get
\[ E_{n-1}^p(f)_{Sp} - \left( \frac{\pi}{2} \right)^{p/2} 2 \sum_{k=n}^{\infty} \rho_k^p(f) \cos kh \]
\[
\leq \left( \frac{\pi}{2} \right)^{p/2} 2 \left\{ \sum_{k=n}^{\infty} \rho_k^p(f) \right\}^{1-2/mp} \left\{ \sum_{k=n}^{\infty} \rho_k^p(f)(1 - \cos kh)^{mp/2} \right\}^{2/(mp)} \]
\[
\leq \left( \frac{\pi}{2} \right)^{1/m} \Psi^{2/m(n)} E_{n-1}^{p-2/m} (f)_{Sp} \left\{ 2 \sum_{k=n}^{\infty} \frac{1}{\Psi^p(k)} \rho_k^p(f)(1 - \cos kh)^{mp/2} \right\}^{2/(mp)} \]
\[
\leq \frac{1}{2} \Psi^{2/m(n)} E_{n-1}^{p-2/m} (f)_{Sp} \omega_m^{2/m} (f^\Psi, h)_{Sp}. \quad (14) \]

Integrating the relation (14) by the variable \( h \) over the limits from 0 to \( \tau \) we have
\[
\tau E_{n-1}^p(f)_{Sp} \leq \left( \frac{\pi}{2} \right)^{p/2} 2 \sum_{k=n}^{\infty} \rho_k^p(f) \sin k\tau \]
\[
+ \frac{\Psi^{2/m(n)}}{2} E_{n-1}^{p-2/m} (f)_{Sp} \int_0^\tau \omega_m^{2/m} (f^\Psi, h)_{Sp} dh. \quad (15) \]

In the [3] it was obtained the relation
\[
\max_{n\tau \leq u} \left| \frac{\sin u}{u} \right| = \frac{\sin n\tau}{n\tau} \quad (0 < n\tau \leq \frac{3\pi}{4}). \quad (16) \]

Dividing the inequality (15) by \( \tau \) and taking into account (7) and (16) we have
\[
E_{n-1}^p(f)_{Sp} \leq \frac{\sin n\tau}{n\tau} E_{n-1}^p(f)_{Sp} \]
\[
+ \frac{\Psi^{2/m(n)}}{2\tau} E_{n-1}^{p-2/m} (f)_{Sp} \int_0^\tau \omega_m^{2/m} (f^\Psi, h)_{Sp} dh. \quad (17) \]

Therefore from (17) we get
\[
E_{n-1}(f)_{Sp} \leq \Psi(n) \left\{ \frac{n}{2(n\tau - \sin n\tau)} \right\}^{m/2} \left\{ \int_0^\tau \omega_m^{2/m} (f^\Psi, h)_{Sp} dh \right\}^{m/2}. \quad (18) \]

From (18) for an arbitrary \( 0 < \tau \leq \frac{3\pi}{4n} \) we have the upper bound
\[
\sup_{f(x) \in L_p^\Psi(S^p)} \left\{ \int_0^\tau \omega_m^{2/m} (f^\Psi, h)_{Sp} dh \right\}^{m/2} \leq \Psi(n) \left\{ \frac{n}{2(n\tau - \sin n\tau)} \right\}^{m/2}. \quad (19) \]

To obtain the lower bound we consider the function
\[ \tilde{f}(x) = \sqrt{2/\pi} \cos(nx), \]
which belongs to the class \( L_p^\Psi(S^p) \).

Based on the (7) we have
\[
E_{n-1}(\tilde{f})_{Sp} = 2^{1/p}. \quad (20) \]
For \((\Psi, \beta)\)-derivative of the function \(\tilde{f}\)
\[
\tilde{f}_\beta^\Psi(x) = \sqrt{2/\pi}\Psi^{-1}(n)\cos(nx + \beta_n\pi/2)
\]
due to (11) and definition of the modulus of continuity of order \(m\) for \(0 < t \leq \frac{\pi}{n}\) we can write
\[
\omega_m(\tilde{f}_\beta^\Psi, t)_{S^p} = 2^{1/p+m/2} \frac{1}{\Psi(n)} (1 - \cos nt)^{m/2}.
\] (21)

From the (21) for \(0 < t \leq \frac{\pi}{n}\) we obtain
\[
\left\{ \int_0^\tau \omega_m^{2/m}(\tilde{f}_\beta^\Psi, h)_{S^p} dh \right\}^{m/2} = \frac{1}{\Psi(n)} 2^{1/p+m/2} \left\{ \tau - \frac{1}{n} \sin nt \right\}^{m/2}.
\] (22)

Then taking into account (20) and (22) we get
\[
\sup_{\int f(x) dS^p \neq \text{const}} \left\{ \int_0^\tau \omega_m^{2/m}(f, h)_{S^p} dh \right\}^{m/2} = \Psi(n) \left\{ \frac{n}{2(n\tau - \sin nt)} \right\}^{m/2}.
\] (23)

From the upper bound (19) and lower bound (23) it follows the equality (5). Theorem 1 is proved.

If \(\Psi(n) = n^{-r}, r \in \mathbb{Z}_+\), then from the theorem 1 it follows the next result.

**Theorem 2.** Let \(r \in \mathbb{Z}_+\) and \(n, m \in \mathbb{N}\). Then for an arbitrary \(0 < \tau \leq \frac{3\pi}{4n}\) the following equality holds
\[
\sup_{\int f(x) dS^p \neq \text{const}} \left\{ \int_0^\tau \omega_m^{2/m}(f, h)_{L^2} dh \right\}^{m/2} = \left\{ \frac{n}{2(n\tau - \sin nt)} \right\}^{m/2}.
\]

The result of the theorem 2 in a certain sense generalizes for the arbitrary modulus of continuity of \(m\)-th order \(\omega_m(f(r), t)_{L^2}(m \in \mathbb{N})\) the result obtained by L.V. Taykov for the case \(m = 1\) in the article [3].

**Conclusions**

For the functions from the class \(L_2^\Psi(S^p)\) \((1 \leq p < \infty)\) the sharp constant in the Jackson-type inequality between the value of the best approximation \(E_{n-1}(f)_{S^p}\) of functions by trigonometric polynomials and moduli of continuity of \(m\)-th order \(\omega_m(f_\beta^\Psi, t)_{S^p}\) in the spaces \(S^p\) has been found.

From the obtained result it follows the statement which in a certain sense generalizes for the arbitrary modulus of continuity of \(m\)-th order \(\omega_m(f(r), t)_{L^2}(m \in \mathbb{N})\) the result obtained by L.V. Taykov for \(m = 1\) in the space \(L_2\).
