Keywords: semilattice, semigroup, binary relation, regular element.

ABSTRACT. The paper gives description of regular elements of the semigroup \( B_x(D) \) which are defined by semilattices of the class \( \Sigma_2(X,8) \), for which intersection the minimal elements is empty. When \( X \) is a finite set, the formulas are derived, by means of which the number of regular elements of the semigroup is calculated. In this case the set of all regular elements is a subsemigroup of the semigroup \( B_x(D) \) which is defined by semilattices of the class \( \Sigma_2(X,8) \).

Introduction

An element \( \alpha \) taken from the semigroup \( B_x(D) \) is called a regular element of \( B_x(D) \), if in \( B_x(D) \) there exists an element \( \beta \) such that \( \alpha \beta \alpha = \alpha \).

Definition 1.1. We say that a complete \( X \)-semilattice of unions \( D \) is an \( XI \)-semilattice of unions if it satisfies the following two conditions:

a) \( \land(D,D_1) \in D \) for any \( t \in D \);  

b) \( Z = \bigcup_{i \in Z} (D,D_1) \) for any nonempty element \( Z \) of \( D \) (see ([1], Definition 1.14.2 and [2], Definition 1.14.2)).

Definition 1.2. The one-to-one mapping \( \varphi \) between the complete \( X \)-semilattices of unions \( D' \) and \( D' \) is called a complete isomorphism if the condition \( \varphi(D_1) = \bigcup_{T \in D_1} \varphi(T) \) is fulfilled for each nonempty subset \( D_1 \) of the semilattice \( D' \) (see ([1], Definition 6.3.2), ([2], Definition 6.3.2) or [3]).

Definition 1.3. Let \( \alpha \) be some binary relation of the semigroup \( B_x(D) \). We say that the complete isomorphism \( \varphi \) between the complete semilattices of unions \( Q \) and \( D' \) is a complete \( \alpha \)-isomorphism if

a) \( Q = V(D,\alpha) \);  
b) \( \varphi(\emptyset) = \emptyset \) for \( \emptyset \in V(D,\alpha) \) and \( \varphi(T) = T \) for all \( T \in V(D,\alpha) \) (see ([1], Definition 6.3.3), ([2], Definition 6.3.3) or [3]).

By the symbol \( \Sigma_2(X,8) \) we denote the class of all \( X \)-semilattices of unions whose every element is isomorphic to an \( X \)-semilattice of form \( D = \{Z_1, Z_6, Z_5, Z_4, Z_3, Z_2, Z_1, \bar{D}\} \), where

\[
\begin{align*}
Z_6 &\subset Z_5 \subset Z_4 \subset D, & Z_6 &\subset Z_4 \subset Z_3 \subset D, & Z_6 &\subset Z_3 \subset Z_2 \subset D, & Z_6 &\subset Z_2 \subset Z_1 \subset \bar{D}, \\
Z_7 &\subset Z_4 \subset Z_2 \subset D, & Z_7 &\subset Z_3 \subset Z_2 \subset D, & Z_7 &\subset Z_2 \subset Z_1 \subset \bar{D}, \\
Z_i \setminus Z_j &\neq \emptyset, & (i,j) &\in \{(7,6),(6,7),(5,4),(4,5),(3,5),(3,4),(2,1),(1,2)\}.
\end{align*}
\]

(see Diagram 16 in Figure 1).

Now assume that \( D \in \Sigma_2(X,8) \). We introduce the following notation:

1) \( Q_1 = \{T\} \), where \( T \in D \) (see diagram 1 in figure 1);

2) \( Q_2 = \{T,T'\} \), where \( T,T' \in D \) and \( T \subset T' \) (see diagram 2 in figure 1);

3) \( Q_3 = \{T,T',T''\} \), where \( T,T',T'' \in D \) and \( T \subset T' \subset T'' \) (see diagram 3 in figure 1);
4) \( Q_4 = \{T, T', T'', D\} \), where \( T, T', T'' \in D \) and \( T \subseteq T' \subseteq T'' \) (see diagram 4 in figure 1);
5) \( Q_5 = \{T, T', T'' \cup T'''\} \), where \( T, T', T'' \in D \), \( T \subseteq T' \), \( T \subseteq T'' \) and \( T \setminus T' \neq \emptyset \), \( T'' \setminus T' \neq \emptyset \) (see diagram 5 in figure 1);
6) \( Q_6 = \{T, Z_a, Z', Z''\} \), where \( T \in \{Z_a, Z_b\} \), \( Z, Z' \in \{Z_a, Z_b, Z_c\} \), \( Z \neq Z' \) and \( Z \setminus Z' \neq \emptyset \), \( Z'' \setminus Z' \neq \emptyset \) (see diagram 6 in figure 1);
7) \( Q_7 = \{T, T', T'' \cup T'''\} \), where \( T, T', T'' \in D \), \( T \subseteq T' \), \( T \subseteq T'' \) and \( T \setminus T' \neq \emptyset \), \( T'' \setminus T' \neq \emptyset \) (see diagram 7 in figure 1);
8) \( Q_8 = \{T, T', Z_a, Z_b, Z'' \cup Z''', D\} \), where \( T \in \{Z_a, Z_b\} \), \( T' \in \{Z_a, Z_b\} \), \( T \subseteq T' \), \( Z_a \cup T', Z_b \in \{Z_a, Z_b\} \), \( Z_a \setminus T' \neq \emptyset \), \( Z_b \setminus T' \neq \emptyset \) and \( (Z_a \setminus T') \setminus Z_b \neq \emptyset \), \( Z_b \setminus (Z_a \setminus T') \neq \emptyset \) (see diagram 8 in figure 1);
9) \( Q_9 = \{T, T', T'' \} \), where \( T, T' \in D \), \( T \setminus T' \neq \emptyset \), \( T'' \setminus T' \neq \emptyset \) and \( T \cap T'' = \emptyset \) (see diagram 9 in figure 1);
10) \( Q_{10} = \{T, T', T'', T'''\} \), where \( T, T', T'' \in D \), \( (T \setminus T') \subseteq T'' \), \( T'' \setminus T' \neq \emptyset \) and \( T \cap T'' = \emptyset \) (see diagram 10 in figure 1);
11) \( Q_{11} = \{Z, Z_a, Z_b, Z_c, Z_d\} \), where \( Z \in \{Z_a, Z_b\} \) and \( Z \setminus Z_a = \emptyset \) (see diagram 11 in figure 1);
12) \( Q_{12} = \{Z, Z_a, Z_b, Z_c, Z_d\} \), where \( Z_a \cap Z_b = \emptyset \) (see diagram 12 in figure 1);
13) \( Q_{13} = \{T, T', T'', T''' \} \), where \( T, T', T'' \in D \), \( T \subseteq T' \), \( Z_a \subseteq T'' \subseteq D \), \( T \subseteq T' \subseteq T'' \), \( Z_a \setminus T'' \neq \emptyset \), \( Z_a \setminus T' \neq \emptyset \) and \( T \cap T'' = \emptyset \) (see diagram 13 in figure 1);
14) \( Q_{14} = \{T, T', T'', T''', D\} \), where \( T, T', T'' \in D \), \( T \subseteq T' \), \( Z_a \subseteq Z_b \subseteq D \), \( T' \subseteq Z_a \subseteq Z_b \), \( Z_a \setminus Z_b \neq \emptyset \), \( Z_a \setminus Z_b \neq \emptyset \) and \( T \cap Z = \emptyset \) (see diagram 14 in figure 1);
15) \( Q_{15} = \{T, T', T'', T''', D\} \), where \( T, T' \in \{Z_a, Z_b\} \), \( T \neq T' \), \( T' \subseteq T'' \), \( T'' \in \{Z_a, Z_b\} \), \( Z_a \subseteq Z \), \( (T'' \setminus Z_a) \subseteq D \), \( T'' \setminus Z_a \neq \emptyset \), \( Z_a \setminus T'' \neq \emptyset \), \( Z \setminus (T'' \setminus Z_a) \neq \emptyset \), \( Z \setminus (T'' \setminus Z_a) \neq \emptyset \) and \( T \cap T'' = \emptyset \) (see diagram 15 in figure 1);
16) \( Q_{16} = \{Z, Z_a, Z_b, Z_c, Z_d\} \), where \( Z_a \cap Z_b = \emptyset \) (see diagram 16 in figure 1).

Figure1. Diagrams of \( Q_i \), \( i=1,2,3,...,16 \).

Denote by the symbol \( \Sigma(Q_i) \) \( i=1,2,3,...,16 \) the set of all \( XI \)-subsemilattices of the semilattice \( D \) isomorphic to \( Q_i \). Assume that \( D' \in \Sigma(Q) \) and denote by the symbol \( R(D') \) the set of all regular elements \( \alpha \) of the semigroup \( BD\{D'\} \), for which the semilattices \( V(D, \alpha) \) and \( Q_i \) are mutually isomorphic and \( V(D, \alpha) = Q_i \).

**Definition 1.4.** Let the symbol \( \Sigma^{\ast}_{XI}(X,D) \) denote the set of all \( XI \)-subsemilattices of the semilattice \( D \).

Let, further, \( D, D' \in \Sigma^{\ast}(X,D) \) and \( \delta_{XI} \subseteq \Sigma^{\ast}_{XI}(X,D) \times \Sigma^{\ast}_{XI}(X,D) \). It is assumed that \( D \delta_{XI} D' \) if and only if there exists some complete isomorphism \( \phi \) between the semilattices \( D \) and \( D' \). One can easily verify that the binary relation \( \delta_{XI} \) is an equivalence relation on the set \( \Sigma^{\ast}_{XI}(X,D) \).
Let the symbol $\Omega_{\alpha}$ denote the $\beta_{\alpha}$-class of equivalence of the set $\Sigma_{\alpha}(X,D)$, where every element is isomorphic to the $X$-semilattice $Q$ and 

$$R^*(Q) = \bigcup_{D \in \Sigma_{\alpha}(D)} R(D^*)$$

Next Lemma approved in [6].

**Lemma 1.1.** If $X$ be a finite set and $|\Omega(Q)| = m_0$, then the following equalities are true:

1. $|R(Q)| = m_0 \cdot 2^{2^{2^{2^{|X|}}}}$;
2. $|R(Q)| = m_0 \cdot 2^{(2^{2^{2^{|X|}}}) - 1} \cdot 2^{2^{2^{2^{|X|}}}}$;
3. $|R(Q)| = m_0 \cdot (2^{2^{2^{2^{|X|}}}} - 1) \cdot 2^{2^{2^{2^{|X|}}}}$;
4. $|R(Q)| = m_0 \cdot (2^{2^{2^{2^{|X|}}}} - 1) \cdot 2^{2^{2^{2^{|X|}}}} \cdot 3^{2^{2^{2^{|X|}}}}$;
5. $|R(Q)| = 2 \cdot m_0 \cdot (2^{2^{2^{2^{|X|}}}} - 1) \cdot 2^{2^{2^{2^{|X|}}}} \cdot 4^{2^{2^{2^{|X|}}}}$;
6. $|R(Q)| = 2 \cdot m_0 \cdot (2^{2^{2^{2^{|X|}}}} - 1) \cdot 2^{2^{2^{2^{|X|}}}} \cdot 4^{2^{2^{2^{|X|}}}} \cdot 5^{2^{2^{2^{|X|}}}}$;
7. $|R(Q)| = 2 \cdot m_0 \cdot (2^{2^{2^{2^{|X|}}}} - 1) \cdot 2^{2^{2^{2^{|X|}}}} \cdot 4^{2^{2^{2^{|X|}}}} \cdot 6^{2^{2^{2^{|X|}}}}$;
8. $|R(Q)| = 2 \cdot m_0 \cdot (2^{2^{2^{2^{|X|}}}} - 1) \cdot 2^{2^{2^{2^{|X|}}}} \cdot 4^{2^{2^{2^{|X|}}}} \cdot 7^{2^{2^{2^{|X|}}}}$;
9. $|R(Q)| = 2 \cdot m_0 \cdot 3^{2^{2^{2^{|X|}}}}$;
10. $|R(Q)| = 2 \cdot m_0 \cdot (2^{2^{2^{2^{|X|}}}} - 1) \cdot 2^{2^{2^{2^{|X|}}}} \cdot 4^{2^{2^{2^{|X|}}}}$;
11. $|R(Q)| = 2 \cdot m_0 \cdot (2^{2^{2^{2^{|X|}}}} - 1) \cdot 2^{2^{2^{2^{|X|}}}} \cdot 4^{2^{2^{2^{|X|}}}}$;
12. $|R(Q)| = 4 \cdot m_0 \cdot (2^{2^{2^{2^{|X|}}}} - 1) \cdot 2^{2^{2^{2^{|X|}}}} \cdot 4^{2^{2^{2^{|X|}}}}$;
13. $|R(Q)| = 4 \cdot m_0 \cdot (2^{2^{2^{2^{|X|}}}} - 1) \cdot 2^{2^{2^{2^{|X|}}}} \cdot 4^{2^{2^{2^{|X|}}}}$;
14. $|R(Q)| = 4 \cdot m_0 \cdot (2^{2^{2^{2^{|X|}}}} - 1) \cdot 2^{2^{2^{2^{|X|}}}} \cdot 4^{2^{2^{2^{|X|}}}}$;
15. $|R(Q)| = 4 \cdot m_0 \cdot (2^{2^{2^{2^{|X|}}}} - 1) \cdot 2^{2^{2^{2^{|X|}}}} \cdot 4^{2^{2^{2^{|X|}}}}$;
16. $|R(Q)| = 4 \cdot m_0 \cdot (2^{2^{2^{2^{|X|}}}} - 1) \cdot 2^{2^{2^{2^{|X|}}}} \cdot 4^{2^{2^{2^{|X|}}}}$.

**Theorem 1.1.** Let $R$ be the set of all regular elements of the semigroup $B_X(D)$. Then the following statements are true:

a) $R(D^*) \cap R(D^*) = \emptyset$ for any $D', D^* \in \Sigma_{\Omega}(D)$ and $D' \neq D^*$;

b) $R = \bigcup_{D' \in \Sigma_{\Omega}(D)} R(D^*)$;

c) If $X$ is a finite set, then $|R| = \sum_{D' \in \Sigma_{\Omega}(D)} |R(D^*)|$ (see ([1], Theorem 6.3.6) or ([2], Theorem 6.3.6) or [3]).

**Result**

**Theorem 2.1.** Let $D = [Z_0, Z_1, Z_2, Z_3, Z_4, Z_5, Z_6, Z_7, Z_8] \in \Sigma_1(X,8)$, $Z_7 \cap Z_8 = \emptyset$, $Z_1 \cap Z_2 \neq \emptyset$ and $Z_6 \cap Z_7 \neq \emptyset$. Then a binary relation $\alpha$ of the semigroup $B_X(D)$ that has a quasinormal representation of the form to be given below is a regular element of this semigroup iff there exist a complete $\alpha$-isomorphism $\phi$ of the semilattice $V(D,\alpha)$ on some subsemilattice $D'$ of the semilattice $D$ that satisfies at least one of the following conditions:

1. $\alpha = X \times T$, where $T \in D$;
2) \( \alpha = (Y^a \times T) \cup (Y^a \times T') \), where \( T, T' \in D \), \( T \subset T' \) and \( Y^a, Y^e \in \{ \emptyset \} \) which satisfies the conditions: \( Y^a \supseteq \phi(T) \), \( Y^a \cap \phi(T') \neq \emptyset \);

3) \( \alpha = (Y^a \times T) \cup (Y^e \times T) \cup (Y^e \times T') \), for some \( T, T', T'' \in D \), \( T \subset T' \subset T'' \), and \( Y^a, Y^e, Y^s \in \{ \emptyset \} \) which satisfies the conditions: \( Y^a \supseteq \phi(T) \), \( Y^a \cup Y^e \supseteq \phi(T') \), \( Y^s \cap \phi(T') = \emptyset \), \( Y^s \cap \phi(T'') = \emptyset \);

4) \( \alpha = (Y^a \times T) \cup (Y^e \times T) \cup (Y^e \times T') \cup (Y^e \times D) \), where \( T, T', T'' \in D \), \( T \subset T' \subset T'' \) and \( Y^a, Y^e, Y^s, Y^e \in \{ \emptyset \} \) which satisfies the conditions: \( Y^a \supseteq \phi(T) \), \( Y^a \cup Y^e \supseteq \phi(T') \), \( Y^s \cup Y^e \cup Y^e \supseteq \phi(T'') \), \( Y^s \cap \phi(T') \neq \emptyset \), \( Y^s \cap \phi(T'') \neq \emptyset \);

5) \( \alpha = (Y^a \times T) \cup (Y^e \times T) \cup (Y^e \times T') \cup (Y^e \times T'') \), for some \( T, T', T'' \in D \), \( T \subset T' \subset T'' \), \( T' \setminus T' \neq \emptyset \) and \( Y^a, Y^e, Y^s, Y^e \in \{ \emptyset \} \) which satisfies the conditions: \( Y^a \cup Y^e \supseteq \phi(T) \), \( Y^a \cup Y^e \supseteq \phi(T') \), \( Y^s \cup Y^e \supseteq \phi(T'') \), \( Y^s \cap \phi(T') \neq \emptyset \), \( Y^s \cap \phi(T'') \neq \emptyset \);

6) \( \alpha = (Y^a \times T) \cup (Y^a \times T) \cup (Y^a \times Z) \cup (Y^a \times Z) \cup (Y^a \times D) \), where \( T \in \{ Z, Z_a \}, Z \in \{ Z, Z_a \} \), \( Z \setminus Z' \neq \emptyset \), \( Z \setminus Z' \neq \emptyset \), \( Y^a \cup Y^e \), \( Y^s \cup Y^e \in \{ \emptyset \} \) and satisfies the conditions: \( Y^a \supseteq \phi(T) \), \( Y^a \cup Y^e \supseteq \phi(Z) \), \( Y^a \cup \phi(Z) \neq \emptyset \), \( Y^s \cap \phi(Z') \neq \emptyset \);

7) \( \alpha = (Y^a \times T) \cup (Y^e \times T) \cup (Y^e \times Z) \cup (Y^e \times (T' + T')) \cup (Y^e \times D) \), where \( T, T', T'' \in D \) and \( T \subset T' \), \( T \cap T' \neq \emptyset \), \( T' \setminus T \neq \emptyset \), \( T' \setminus T' \neq \emptyset \), \( Y^a \cup Y^e \cup Y^s \), \( Y^e \in \{ \emptyset \} \) and satisfies the conditions: \( Y^a \cup Y^e \supseteq \phi(T) \), \( Y^a \cup Y^e \supseteq \phi(Z) \), \( Y^s \cap \phi(Z') \neq \emptyset \);

8) \( \alpha = (Y^a \times T) \cup (Y^a \times T) \cup (Y^a \times Z) \cup (Y^a \times Z) \cup (Y^a \times D) \), where \( T \in \{ Z, Z_a \}, T' \in \{ Z, Z_a \} \), \( Z \setminus Z' \neq \emptyset \), \( Z \setminus Z' \neq \emptyset \), \( Z \cap T' \neq \emptyset \), \( Z \setminus Z' \neq \emptyset \), \( Y^a \cup Y^e \cup Y^s \), \( Y^e \in \{ \emptyset \} \) and satisfies the conditions: \( Y^a \cup Y^e \supseteq \phi(T) \), \( Y^a \cup Y^e \supseteq \phi(Z) \), \( Y^s \cap \phi(Z') \neq \emptyset \);

9) \( \alpha = (Y^a \times Z) \cup (Y^a \times Z) \cup (Y^a \times D) \), where \( Y^a, Y^e \in \{ \emptyset \} \), and satisfies the conditions: \( Y^a \supseteq \phi(Z) \), \( Y^a \supseteq \phi(Z) \);

10) \( \alpha = (Y^a \times Z) \cup (Y^a \times Z) \cup (Y^a \times D) \), where \( T \in \{ Z, Z_a \} \), \( Y^a, Y^e, Y^e \in \{ \emptyset \} \) and satisfies the conditions: \( Y^a \supseteq \phi(Z) \), \( Y^a \supseteq \phi(Z) \);

11) \( \alpha = (Y^a \times Z) \cup (Y^a \times Z) \cup (Y^a \times D) \), where \( T \in \{ Z, Z_a \} \), \( Y^a, Y^e, Y^e, Y^e \in \{ \emptyset \} \) and satisfies the conditions: \( Y^a \supseteq \phi(Z) \), \( Y^a \supseteq \phi(Z) \), \( Y^a \cup Y^a \cup Y^a \cup Y^a \supseteq \phi(T) \), \( Y^a \cap \phi(T) \neq \emptyset \);

12) \( \alpha = (Y^a \times Z) \cup (Y^a \times Z) \cup (Y^a \times Z) \cup (Y^a \times D) \), where \( Y^a, Y^a, Y^a, Y^e \in \{ \emptyset \} \) and satisfies the conditions: \( Y^a \supseteq \phi(Z) \), \( Y^a \supseteq \phi(Z) \), \( Y^a \cup Y^a \cup Y^a \cup Y^a \supseteq \phi(Z) \), \( Y^a \cup Y^a \cup Y^a \cup Y^a \supseteq \phi(Z) \);

Proof. In this case, when \( Z_a \cap Z_a = \emptyset \), \( Z \cap Z_a \neq \emptyset \) and \( Z \cap Z_a \neq \emptyset \), from the Lemma 2.4 in [7] it follows that diagrams 1-12 given in fig.1 exhibit all diagrams of \( \mathcal{X}_{T} \)-subsemilattices of the semilattices \( D \), a quasigonal representation of regular elements of the semigroup \( B_{r}(D) \), which are defined by these \( \mathcal{X}_{T} \)-subsemilattices, may have one of the forms listed above. The statements 1)-4) immediately follows from the Theorems 13.1.1 in [1], Theorems 13.1.1 in [2], the statements 5)-7) immediately follows from the Theorems 13.3.1 in [1], Theorems 13.3.1 in [2] and the statement 8) immediately follows from the Theorems 13.7.1 in [1], Theorems 13.7.1 in [2], the statements 9)-11) immediately follows from the Theorem 13.2.1 in [1], 13.2.1 in [2], the statement 12) immediately follows from the Theorem 13.5.1 in [1], Theorems 13.5.1 in [2].

The Theorem is proved.

9) Let binary relation \( \alpha \) of the semigroup \( B_{r}(D) \) satisfying the condition 9) of the Theorem 2.1. In this case we have that
If the equalities $D_1 = \{Z_7, Z_6, Z_4\}$, $D_2 = \{Z_6, Z_7, Z_4\}$ are fulfilled, then
$$R'(Q_x) = R(D'_1) \cup R(D'_2)$$
(2.1)

(see Definition 1.4).

**Lemma 2.1.** Let $D = \{Z_1, Z_2, Z_3, Z_4, Z_5, \bar{Z}_6\} \in \Sigma_1(X, 8)$, $Z_7 \cap Z_8 = \emptyset$, $Z_7 \cap Z_9 \neq \emptyset$ and $Z_6 \cap Z_8 \neq \emptyset$. If $X$ be a finite set and by $R'(Q_x)$ denoted all regular elements of the semigroup $B_X(D)$ satisfying the condition 9) of the Theorem 2.1, then
$$|R'(Q_x)| = |R(D'_1)| + |R(D'_2)|$$

**Proof:** First we show that the following equality is true:
$$R(D'_1) \cap R(D'_2) = \emptyset$$
(2.2)

If $\alpha \in R(D'_1) \cap R(D'_2)$, then
$$Y_\alpha^r \supseteq Z_1, \ Y_\alpha^r \supseteq Z_2, \ Y_\alpha^r \supseteq Z_3, \ Y_\alpha^r \supseteq Z_4,$$
$$Y_\alpha^r \supseteq Z_5, \ Y_\alpha^r \supseteq Z_6,$$

It follows that $Y_\alpha^r \supseteq Z_1 \cup Z_6 = Z_4$, $Y_\alpha^r \supseteq Z_6 \cup Z_1 = Z_4$ and $Y_\alpha^r \cap Y_\alpha^r \supseteq Z_4 \cup Z_4 \neq \emptyset$, but the inequality $Y_\alpha^r \cap Y_\alpha^r \neq \emptyset$ contradiction of the condition that representation of binary relation $\alpha$ is quasinormal. So, the equality $R(D'_1) \cap R(D'_2) = \emptyset$ is hold.

Now by the equalities of (2.1) and (2.2) immediately follows that the following equality is true
$$|R'(Q_x)| = |R(D'_1)| + |R(D'_2)|$$

The Lemma is proved.

**Lemma 2.2.** Let $D = \{Z_1, Z_2, Z_3, Z_4, Z_5, \bar{Z}_6\} \in \Sigma_1(X, 8)$, $Z_7 \cap Z_8 = \emptyset$, $Z_7 \cap Z_9 \neq \emptyset$ and $Z_6 \cap Z_8 \neq \emptyset$. If $X$ is a finite set, then
$$|R'(Q_x)| = 2 \cdot 3^{R-4}$$

**Proof:** As is well known $|\Phi(Q_x, Q_x)| = 2$ (see [7]) and $|\Omega(Q_x)| = 1$, then by Lemma 2.1 and by statement 9) of Lemma 1.1 we obtain the validity of Lemma 2.2.

The Lemma is proved.

10. Let binary relation $\alpha$ of the semigroup $B_X(D)$ satisfying the condition 10) of the Theorem 2.1. In this case we have that

If the equalities
$$D'_1 = \{Z_1, Z_6, Z_4, \bar{Z}_5\}, \ D'_2 = \{Z_6, Z_1, Z_4, \bar{Z}_5\}, \ D'_3 = \{Z_6, Z_1, Z_4, \bar{Z}_5\},$$
$$D'_4 = \{Z_6, Z_1, Z_4, \bar{Z}_5\}, \ D'_5 = \{Z_6, Z_1, Z_4, \bar{Z}_5\}, \ D'_6 = \{Z_6, Z_1, Z_4, \bar{Z}_5\},$$

are fulfilled, then
$$R'(Q_{10}) = R(D'_1) \cup R(D'_2) \cup R(D'_3) \cup R(D'_4) \cup R(D'_5) \cup R(D'_6)$$
(2.3)

(see Definition 1.4).

**Lemma 2.3.** Let $D = \{Z_1, Z_2, Z_3, Z_4, Z_5, \bar{Z}_6\} \in \Sigma_1(X, 8)$, $Z_7 \cap Z_8 = \emptyset$, $Z_7 \cap Z_9 \neq \emptyset$ and $Z_6 \cap Z_8 \neq \emptyset$. If $X$ is a finite set and by $R'(Q_{10})$ denoted all regular elements of the semigroup $B_X(D)$ satisfying the condition 10) of the Theorem 2.1, then
$$|R'(Q_{10})| = |R(D'_1)| + |R(D'_2)|$$

**Proof:** Let $\alpha \in R(D'_1)$, then quasinormal representation of a binary relation $\alpha$ has form $\alpha = (Y_\alpha^r \times Z_1) \cup (Y_\alpha^r \times Z_4) \cup (Y_\alpha^r \times T)$, where $T \in \{Z_2, Z_3, \bar{Z}_6\}$, $Y_\alpha^r, Y_\alpha^r, Y_\alpha^r \notin \{\emptyset\}$ and by statement 10) of the theorem 2.1 satisfies the conditions $Y_\alpha^r \supseteq Z_7$, $Y_\alpha^r \supseteq Z_4$, $Y_\alpha^r \cap Z_7 \neq \emptyset$. By definition of the semilattice $D$ we have $Z_7 \supseteq Z_7$, $Z_4 \supseteq Z_4$ and $\bar{Z}_7 \supseteq Z_2$, therefore
$$Y_\alpha^r \supseteq Z_7, \ Y_\alpha^r \supseteq Z_4, \ Y_\alpha^r \cap Z_7 \neq \emptyset$$

i.e. $\alpha \in R(D'_1)$. Of this we have
$$R(D'_1) \subseteq R(D'_2), \ R(D'_2) \subseteq R(D'_3), \ R(D'_3) \subseteq R(D'_4)$$
By the equality (2.3) we have
\[ R^*(Q_0) = R(D_1') \cup R(D_1) \] (2.4)
Now we show that the following equality is true:
\[ R(D_1') \cap R(D_1') = \emptyset \] (2.5)
If \( \alpha \in R(D_1') \cap R(D_1') \), then
\[ Y_7' \supseteq Z_7, Y_6'' \supseteq Z_6, Y_6'' \cup Y_7'' \cup Y_4'' \cup Y_2'' \supseteq Z_4, Y_4'' \cap \bar{D} \neq \emptyset, \]
\[ Y_7' \supseteq Z_7, Y_6'' \supseteq Z_6, Y_6'' \cup Y_7'' \cup Y_4'' \cup Y_2'' \supseteq Z_4, Y_4'' \cap \bar{D} \neq \emptyset \]
It follows that \( Y_7'' \supseteq Z_7 \cup Z_6 = Z_4, Y_6'' \supseteq Z_6 \lor Z_7 = Z_4 \) and \( Y_7'' \land Y_6'' \supseteq Z_4 \land Z_4 \neq \emptyset \), but the inequality \( Y_7'' \land Y_6'' \neq \emptyset \) contradiction of the condition that representation of binary relation \( \alpha \) is quazinormal.
So, the equality \( R(D_1') \cap R(D_1') = \emptyset \) is hold.

Now by the equalities of (2.4) and (2.5) immediately follows that the following equality is true
\[ R^*(Q_0) = \left| R(D_1') \right| + \left| R(D_1') \right| \]
The Lemma is proved.

**Lemma 2.4.** Let \( D = \{Z_1, Z_2, Z_3, Z_4, Z_5, Z_6, \bar{D}\} \subseteq \Sigma_2(X,8) \), \( Z_7 \cap Z_8 = \emptyset, Z_7 \cap Z_3 \neq \emptyset \) and \( Z_6 \cap Z_5 \neq \emptyset \). If \( X \) is a finite set, then
\[ \left| R(Q_0) \right| = 6 \cdot \left( 4^{|Z_2|} - 3^{|Z_3|} \right) \cdot 4^{|Z_1|} \]

**Proof:** As is well known \( \left| \Phi(Q_0, Q_0) \right| = 2 \) (see [7]) and \( \left| \Omega(Q_0) \right| = 3 \), then by lemma 2.3 and by statement 10) of Lemma 1.1 we obtain the validity of Lemma 2.4.

The Lemma is proved.

11) Let binary relation \( \alpha \) of the semigroup \( B_x(D) \) satisfying the condition 11) of the Theorem 2.1. In this case we have that
\[ Q_{11} = \{Z_7, Z_6, Z_5, Z_2, \bar{D}, D, Z_7, Z_6, Z_5, Z_1, \bar{D}\} \]
If the equalities
\[ D_1' = \{Z_7, Z_6, Z_5, Z_2, \bar{D}\}, D_1 = \{Z_7, Z_6, Z_5, \bar{D}\}, \]
\[ D_2' = \{Z_7, Z_6, Z_5, Z_1, \bar{D}\}, D_2 = \{Z_7, Z_6, Z_5, Z_1\} \]
are fulfilled, then
\[ R^*(Q_{11}) = R(D_1') \cup R(D_1') \cup R(D_2') \cup R(D_2') \] (2.6)
(see Definition 5.2).

**Lemma 2.5.** Let \( D = \{Z_1, Z_2, Z_3, Z_4, Z_5, Z_6, \bar{D}\} \subseteq \Sigma_2(X,8) \), \( Z_7 \cap Z_8 = \emptyset, Z_7 \cap Z_3 \neq \emptyset \) and \( Z_6 \cap Z_5 \neq \emptyset \). If \( X \) is a finite set and by \( R^*(Q_{11}) \) denoted all regular elements of the semigroup \( B_x(D) \) satisfying the condition 11) of the Theorem 2.1, then
\[ \left| R^*(Q_{11}) \right| = \left| R(D_1') \right| + \left| R(D_1') \right| + \left| R(D_1') \right| + \left| R(D_1') \right| \]

**Proof:** Now we show that the following equalities are true:
\[ R(D_1') \cap R(D_1') = \emptyset, R(D_1') \cap R(D_1') = \emptyset, R(D_1') \cap R(D_1') = \emptyset, R(D_1') \cap R(D_1') = \emptyset, \]
(2.7)
For this we consider the following case.

1) \( \alpha \in R(D_1') \cap R(D_1') \), then
\[ Y_7' \supseteq Z_7, Y_6'' \supseteq Z_6, Y_6'' \cup Y_7'' \cup Y_4'' \cup Y_2'' \supseteq Z_4, Y_4'' \cap \bar{D} \neq \emptyset, \]
\[ Y_7' \supseteq Z_7, Y_6'' \supseteq Z_6, Y_6'' \cup Y_7'' \cup Y_4'' \cup Y_2'' \supseteq Z_4, Y_4'' \cap \bar{D} \neq \emptyset \]
It follows that \( Y_7'' \supseteq Z_7 \cup Z_6 = Z_4, Y_6'' \supseteq Z_6 \lor Z_7 = Z_4 \) and \( Y_7'' \land Y_6'' \supseteq Z_4 \land Z_4 \neq \emptyset \), but the inequality \( Y_7'' \land Y_6'' \neq \emptyset \) contradiction of the condition that representation of binary relation \( \alpha \) is quazinormal.
So the equality \( R(D_1') \cap R(D_1') = \emptyset \) is hold.

The similar way we can show that the following equalities are hold:
\[ R(D_1') \cap R(D_1') = \emptyset, R(D_1') \cap R(D_1') = \emptyset, R(D_1') \cap R(D_1') = \emptyset. \]
2) If $\alpha \in R(D') \cap R(D')$, then

$Y^\alpha \supseteq Z_1, Y^\alpha \supseteq Z_1, Y^\alpha \supseteq Z_1, Y^\alpha \supseteq Z_1, Y^\alpha \cap Z_1 \neq \emptyset, Y^\alpha \cap D \neq \emptyset$.

It follows that $Y^\alpha \supseteq Y^\alpha \supseteq Y^\alpha \supseteq Y^\alpha \supseteq \emptyset$ and $(Y^\alpha \supseteq Y^\alpha \supseteq Y^\alpha \supseteq Y^\alpha \supseteq \emptyset \neq \emptyset)$, but the inequality $(Y^\alpha \supseteq Y^\alpha \supseteq Y^\alpha \supseteq Y^\alpha \supseteq \emptyset \neq \emptyset)$ contradicts the condition that representation of binary relation $\alpha$ is quasinormal. So, the equality $(R(D') \cap R(D') = \emptyset$ is true.

The similar way we can show that the following equality is hold:

$(R(D') \cap R(D') = \emptyset$.

Now by the equalities of (2.6) and (2.7) immediately follows that the following equality is true:

$(R(D') \cap R(D') = \emptyset$.

The Lemma is proved.

**Lemma 2.6.** Let $D = \{Z_1, Z_2, Z_3, Z_4, Z_5, Z_6, Z_7, Z_8\} \in \Sigma$, $Z_1 \cap Z_6 = \emptyset$, $Z_1 \cap Z_3 = \emptyset$ and $Z_6 \cap Z_7 = \emptyset$. If $X$ is a finite set, then

$R^{\alpha}(Q_1) = 4 \cdot (4^{E[Z]} - 3^{E[Z]} \cdot \cdot \cdot) + 3^{E[Z]} + 4 \cdot (4^{E[Z]} - 3^{E[Z]} \cdot \cdot \cdot) + 3^{E[Z]} + 4 \cdot (4^{E[Z]} - 3^{E[Z]} \cdot \cdot \cdot) + 3^{E[Z]} + \cdot \cdot \cdot$

**Proof:** As is well known $|\Phi(Q_1, Q_1)| = 2$ (see [7]) and $|\Omega(Q_1)| = 2$, then by Lemma 2.5 and by statement 11) of Lemma 1.1 we obtain the validity of Lemma 2.6.

The Lemma is proved.

12) Let binary relation $\alpha$ of the semigroup $B_\alpha(D)$ satisfying the condition 12) of the Theorem 2.1. In this case we have that

$Q_{12} = \{(Z_1, Z_6, Z_4, Z_2, Z_1, D)\}$.

If the equality $D' = \{Z_7, Z_4, Z_2, Z_3, D\}$ is fulfilled, then $R^{\alpha}(Q_1) = R(D')$ (see Definition 1.4) and

$R^{\alpha}(Q_2) = |R(D')|$(2.8)

**Lemma 2.7.** Let $D = \{Z_1, Z_2, Z_3, Z_4, Z_5, Z_6, Z_7, Z_8\} \in \Sigma$, $Z_1 \cap Z_6 = \emptyset$, $Z_1 \cap Z_3 = \emptyset$ and $Z_6 \cap Z_7 = \emptyset$. If $X$ is a finite set, then

$R^{\alpha}(Q_2) = 4 \cdot (4^{E[Z]} - 3^{E[Z]} \cdot \cdot \cdot) + 3^{E[Z]} + 4 \cdot (4^{E[Z]} - 3^{E[Z]} \cdot \cdot \cdot) + 3^{E[Z]} + 4 \cdot (4^{E[Z]} - 3^{E[Z]} \cdot \cdot \cdot) + 3^{E[Z]} + \cdot \cdot \cdot$

**Proof:** As is well known $|\Phi(Q_2, Q_2)| = 4$ (see [7]) and $|\Omega(Q_2)| = 1$, then by equality of (2.8) and by statement 12) of Lemma 1.1 we obtain the validity of Lemma 2.7.

The Lemma is proved.

It was seen in [6] that $r_2 = 4 \cdot \sum_{i=1}^{k}|R^{\alpha}(Q_i)|$. Now, Let $X$ is a finite set and us assume that

$r_2 = 4 \cdot \sum_{i=1}^{k}|R^{\alpha}(Q_i)| + |R^{\alpha}(Q_0)| + |R^{\alpha}(Q_1)| + |R^{\alpha}(Q_2)| =
= 2 \cdot 3^{E[Z]} + 6 \cdot (4^{E[Z]} - 3^{E[Z]} \cdot \cdot \cdot) + 3^{E[Z]} + 4 \cdot (4^{E[Z]} - 3^{E[Z]} \cdot \cdot \cdot) + 3^{E[Z]} + 4 \cdot (4^{E[Z]} - 3^{E[Z]} \cdot \cdot \cdot) + 3^{E[Z]} + \cdot \cdot \cdot$

**Theorem 2.2.** Let $D = \{Z_1, Z_2, Z_3, Z_4, Z_5, Z_6, Z_7, Z_8\} \in \Sigma$, $Z_1 \cap Z_6 = \emptyset$, $Z_1 \cap Z_3 = \emptyset$, $Z_6 \cap Z_7 = \emptyset$. If $X$ is a finite set and $R_\alpha$ is a set of all regular elements of the semigroup $B_\alpha(D)$, then $|R_\alpha| = r_1 + r_2$.

**Proof:** This Theorem immediately follows from the Theorem 2.1.

The Theorem is proved.

**Example 2.1.** Let $X = \{1, 2, 3, 4, 5, 6\}$.

$P_0 = \emptyset, P_1 = \{1\}, P_2 = \{2\}, P_3 = \{3\}, P_4 = \emptyset, P_5 = \{4\}, P_6 = \{5\}, P_7 = \{6\}$. 

International Journal of Pure Mathematical Sciences Vol. 16
Then $D = \{1, 2, 3, 4, 5, 6\}, Z_1 = \{2, 3, 4, 5, 6\}, Z_2 = \{1, 3, 4, 5, 6\}, Z_3 = \{2, 4, 5, 6\}, Z_4 = \{3, 4, 5, 6\}, Z_5 = \{1, 3, 5, 6\}, Z_6 = \{4, 6\}, Z_7 = \{3, 5\}$ and

$$D = \{\{3, 5\}, \{4, 6\}, \{1, 3, 5, 6\}, \{2, 3, 4, 5, 6\}, \{1, 2, 3, 4, 5, 6\}\}.$$  

Therefore we have that following equality and inequality is valid:

$$Z_i \cap Z_j = \{3, 5\} \cap \{4, 6\} = \emptyset,$$

where $Z_i \cap Z_j = \{3, 5\} \cap \{2, 4, 5, 6\} = \{5\} \neq \emptyset,$

$Z_k \cap Z_m = \{4, 6\} \cap \{1, 3, 5, 6\} = \{6\} \neq \emptyset,$

Where $|R (Q_i)| = 8, |R (Q_j)| = 513, |R (Q_k)| = 900, |R (Q_m)| = 108, |R (Q_n)| = 126, |R (Q_p)| = 24, |R (Q_r)| = 8, |R (Q_s)| = 4, |R (Q_t)| = 18, |R (Q_u)| = 42, |R (Q_v)| = 8, |R (Q_w)| = 4, |R (X)| = 1763.$

**Theorem 3.1.** Let $D = \{Z_1, Z_2, Z_3, Z_4, Z_5, Z_6, Z_7\} \in \Sigma (X, 8), Z_7 \cap Z_5 = \emptyset$ and $Z_6 \cap Z_5 \neq \emptyset$. Then a binary relation $\alpha$ of the semigroup $B_x (D)$ that has a quasinormal representation of the form to be given below is a regular element of this semigroup iff there exist a complete $\alpha$–isomorphism $\varphi$ of the semilattice $V(D, \alpha)$ on some subsemilattice $D'$ of the semilattice $D$ that satisfies at least one of the Theorem 2.1 and only one following conditions:

9) $\alpha = (Y_v^* \times T) \cup (Y_v^* \times T') \cup (Y_v^* \times T \cup T'),$ where $T, T' \in D, T \cap T' \neq \emptyset, T' \cap T \neq \emptyset, Y_v^*, Y_v^* \notin \{\emptyset\}$ and satisfies the conditions: $Y_v^* \supseteq \varphi (T), Y_v^* \supseteq \varphi (T);$

10) $\alpha = (Y_v^* \times T) \cup (Y_v^* \times T') \cup (Y_v^* \times T' \cup T'),$ where $T, T' \in D, T \cap T' \neq \emptyset, T' \cap T \neq \emptyset, Y_v^*, Y_v^* \notin \{\emptyset\}$ and satisfies the conditions: $Y_v^* \supseteq \varphi (T), Y_v^* \supseteq \varphi (T'), Y_v^* \cap \varphi (T') \neq \emptyset;$

13) $\alpha = (Y_v^* \times Z_i) \cup (Y_v^* \times Z_j) \cup (Y_v^* \times Z_k) \cup (Y_v^* \times Z_l) \cup (Y_v^* \times Z_m),$ where $Y_v^*, Y_v^* \notin \{\emptyset\}$ and satisfies the conditions: $Y_v^* \supseteq \varphi (Z_i), Y_v^* \supseteq \varphi (Z_j), Y_v^* \supseteq \varphi (Z_k), Y_v^* \supseteq \varphi (Z_m);$

14) $\alpha = (Y_v^* \times Z_i) \cup (Y_v^* \times Z_j) \cup (Y_v^* \times Z_k) \cup (Y_v^* \times Z_l) \cup (Y_v^* \times D),$ where $Y_v^*, Y_v^* \notin \{\emptyset\}$ and satisfies the conditions: $Y_v^* \supseteq \varphi (Z_i), Y_v^* \supseteq \varphi (Z_j), Y_v^* \supseteq \varphi (Z_k), Y_v^* \supseteq \varphi (Z_l), Y_v^* \supseteq \varphi (D);$

15) $\alpha = (Y_v^* \times Z_i) \cup (Y_v^* \times Z_j) \cup (Y_v^* \times Z_k) \cup (Y_v^* \times Z_l) \cup (Y_v^* \times D),$ where $Y_v^*, Y_v^* \notin \{\emptyset\}$ and satisfies the conditions: $Y_v^* \supseteq \varphi (Z_i), Y_v^* \supseteq \varphi (Z_j), Y_v^* \supseteq \varphi (Z_k), Y_v^* \supseteq \varphi (Z_l), Y_v^* \supseteq \varphi (Z_m), Y_v^* \supseteq \varphi (D);$

**Proof.** In this case, when $Z_7 \cap Z_5 = \emptyset$ and $Z_6 \cap Z_7 \neq \emptyset$, from the Lemma 2.5 in [7] it follows that diagrams 1-15 given in fig.1 exhibit all diagrams of $\mathcal{X}_I$–subsemilattices of the semilattices $D$, a quasinormal representation of regular elements of the semigroup $B_x (D)$, which are defined by these $\mathcal{X}_I$–semilattices, may have one of the forms listed above. The statements 9), 10) immediately follows from the Theorem 13.2.1 in [1], 13.2.1 in [2], the statements 13), 14) immediately follows from the Theorem 13.4.1 in [1], 13.4.1 in [2], the statement 15) immediately follows from the Theorem 13.10.1 in [1].

The Theorem is proved.

9) Let binary relation $\alpha$ of the semigroup $B_x (D)$ satisfying the condition 9) of the Theorem 3.1. In this case we have that

$$Q_0 = \{Z_1, Z_2, Z_3, Z_4, \{Z_1, Z_3, Z_4\}\}.$$  

If the equalities $D_1 = \{Z_1, Z_2, Z_4\}, D_2 = \{Z_6, Z_7, Z_4\}, D_3 = \{Z_7, Z_5, Z_4\}, D_4 = \{Z_7, Z_7, Z_4\}$ are fulfilled, then

$$R (Q_0) = R (D_1) \cup R (D_2) \cup R (D_3) \cup R (D_4) (2.1)$$

(see Definition 1.4).

**Lemma 3.1.** Let $D = \{Z_1, Z_2, Z_3, Z_4, Z_5, Z_7, Z_5, D\} \in \Sigma (X, 8), Z_7 \cap Z_5 = \emptyset$ and $Z_6 \cap Z_7 \neq \emptyset$. If $X$ is a finite set and by $R (Q_0)$ denoted all regular elements of the semigroup $B_x (D)$ satisfying the condition 9) of the Theorem 3.1, then
Proof: Let \( \alpha \in R(D') \), then quasinormal representation of a binary relation \( \alpha \) has form 
\[
\alpha = (Y^a_r \times T) \cup (Y^a_r \times T') \cup (Y^a_{r,t} \times (T \cup T'))
\]
for some \( T \setminus T' \neq \emptyset \), \( T' \setminus T \neq \emptyset \), \( T, T' \in D \), \( Y^a_r, Y^a_r' \notin \{ \emptyset \} \) and by statement 9) of the theorem 3.1 satisfies the conditions \( Y^a_r \supseteq Z \), \( Y^a_r' \supseteq Z \). By definition of the semilattice \( D \) we have \( Z \supseteq Z \) and \( Z \supseteq Z \). Of this we have: \( Y^a_r \supseteq Z \), \( Y^a_r \supseteq Z \), i.e. \( \alpha \in R(D') \). It follows that \( R(D') \subseteq R(D) \). Of this we have \( R(D'_1) \subseteq R(D') \).

Therefore by the equality (3.1) we have
\[
R^*(Q_0) = R(D'_1) \cup R(D'_2)
\]  
(3.2)
Now we show that the following equality is true:
\[
R(D'_1) \cap R(D'_2) = \emptyset
\]  
(3.3)
If \( \alpha \in R(D'_1) \cap R(D'_2) \), then
\[
Y^a_r \supseteq Z_r, Y^a_r' \supseteq Z_r,
\]
\[
Y^a_r \supseteq Z_r, Y^a_r' \supseteq Z_r,
\]
It follows that \( Y^a_r \supseteq Z_r \cup Z_r = Z_r, Y^a_r \supseteq Z_r \cup Z_r = Z_r \) and \( Y^a_r \cap Y^a_r' \supseteq Z_r \cap Z_r \neq \emptyset \), but the inequality \( Y^a_r \cap Y^a_r' \neq \emptyset \) contradiction of the condition that representation of binary relation \( \alpha \) is quazinormal.
So, the equality \( R(D'_1) \cap R(D'_2) = \emptyset \) is hold.

Now by the equalities of (3.2) and (3.3) immediately follows that the following equality is true
\[
R^*(Q_0) = R(D'1) + R(D'2)
\]
The Lemma is proved.

Lemma 3.2. Let \( D = \{Z_1, Z_2, Z_3, Z_4, Z_5, Z_6, D\} \subseteq \Sigma_8 \), \( Z_1 \cap Z_2 = \emptyset, Z_2 \cap Z_5 = \emptyset \). If \( X \) is a finite set, then
\[
|R^*(Q_0)| = 4 \cdot 3^{X+1}
\]
Proof: As is well known \( |\Phi(Q_0, Q_0)| = 2 \) (see [7]) and \( |\Omega(Q_0)| = 2 \), then by Lemma 3.1 and by statement 9) of Lemma 1.1 we obtain the validity of Lemma 3.2.

10) Let binary relation \( \alpha \) of the semigroup \( B_8(D) \) satisfying the condition 10) of the Theorem 3.1. In this case we have that
\[
Q_0 \alpha_{X} = \{ \{Z_1, Z_2, Z_3, Z_4, D\}, \{Z_1, Z_2, Z_3, Z_4, Z_5\}, \{Z_1, Z_2, Z_3, Z_4, Z_5, D\}, \{Z_1, Z_2, Z_3, Z_4, Z_5, D\}\}
\]
If the equalities
\[
D_1 = \{Z_1, D\}, D_2 = \{Z_2, D\}, D_3 = \{Z_3, D\}, D_4 = \{Z_4, D\}
\]
\[
D_5 = \{Z_5, D\}, D_6 = \{Z_6, D\}, D_7 = \{Z_7, D\}, D_8 = \{Z_8, D\}
\]
are fulfilled, then
\[
R^*(Q_0) = \bigcup_{i=1}^{8} R(D'_i)
\]  
(3.4)
(see Definition 1.4).

Lemma 3.3. Let \( D = \{Z_1, Z_2, Z_3, Z_4, Z_5, Z_6, D\} \subseteq \Sigma_8 \), \( Z_1 \cap Z_2 = \emptyset \) and \( Z_2 \cap Z_3 = \emptyset \). If \( X \) is a finite set and by \( R^*(Q_0) \) denoted all regular elements of the semigroup \( B_8(D) \) satisfying the condition 10) of the Theorem 3.1, then
\[
|R^*(Q_0)| = |R(D'_1)| + |R(D'_2)|
\]
Proof: Let \( \alpha \in R(D'_1) \), then quasinormal representation of a binary relation \( \alpha \) has form 
\[
\alpha = (Y^a_r \times T) \cup (Y^a_r \times T') \cup (Y^a_{r,t} \times (T \cup T')) \cup (Y^a_r \times T')
\]
for some \( T, T', T'' \in D \), \( T \setminus T' \neq \emptyset \), \( T' \setminus T \neq \emptyset \), \( T \cup T' \neq T'' \), \( Y^a_r, Y^a_r', Y^a_r'' \notin \{ \emptyset \} \) and by statement 10) of the theorem 3.1 satisfies the conditions \( Y^a_r \supseteq Z \), \( Y^a_r \supseteq Z \), \( Y^a_r \cap Z \neq \emptyset \). By definition of the semilattice \( D \) we have \( Z \subseteq Z \) or \( Z \subseteq Z \) and \( D \supseteq Z \), therefore:
\[
Y^a_r \supseteq Z, Y^a_r \supseteq Z, Y^a_r \cap Z \neq \emptyset
\]
\( i.e. \alpha \in R(D') \). Of this we have

\[
R(D_1') \subset R(D_1'), R(D_2') \subset R(D_2'), R(D_3') \subset R(D_3'), R(D_4') \subset R(D_4'), R(D_5') \subset R(D_5'),
\]

By the equality (3.4) we have

\[
R^*(Q_0) = R(D_1') \cup R(D_2') \quad (3.5)
\]

Now we show that the following equality is true:

\[
R(D_1') \cap R(D_2') = \emptyset \quad (3.6)
\]

If \( \alpha \in R(D_1') \cap R(D_2') \), then

\[
Y_\alpha \supseteq Z_\alpha, Y_\alpha \supseteq Z_\alpha, Y_\alpha \cup Y_\alpha \cup Y_\alpha \cup Y_\alpha \supseteq Z_\alpha, Y_\alpha \cap D \neq \emptyset,
\]

It follows that \( Y_\alpha \supseteq Z_\alpha \cup Z_\alpha = Z_\alpha, Y_\alpha \supseteq Z_\alpha \cup Z_\alpha = Z_\alpha \), and \( Y_\alpha \cap Y_\alpha \neq \emptyset \), but the inequality \( Y_\alpha \cap Y_\alpha \neq \emptyset \) contradiction of the condition that representation of binary relation \( \alpha \) is quazinormal. So, the equality \( R(D_1') \cap R(D_2') = \emptyset \) is hold.

Now by the equalities of (3.5) and (3.6) immediately follows that the following equality is true

\[
\frac{R^*(Q_0)}{R(D_1')} = \frac{R(D_2')}{} \quad \text{The Lemma is proved.}
\]

**Lemma 3.4.** Let \( D = \{Z_1, Z_2, Z_3, Z_4, Z_5, Z_6, D\} \subseteq \Sigma (x, 8) \), \( Z_1 \cap Z_3 = \emptyset, Z_4 \cap Z_5 \neq \emptyset \). If \( X \) is a finite set, then

\[
|R^*(Q_0)| = 8 \cdot 4^{p-x_1} - 3^{p-x_1} \cdot 4^{p-x_1}
\]

**Proof:** As is well known \( |\Phi(Q_0, Q_0)| = 2 \) (see [7]) and \( |\Omega(Q_0)| = 4 \), then by lemma 3.3 and by statement 10) of Lemma 1.1 we obtain the validity of Lemma 3.4.

The Lemma is proved.

13) Let binary relation \( \alpha \) of the semigroup \( B_x (D) \) satisfying the condition 13) of the Theorem 3.1. In this case we have that \( Q_{13} = \{Z_1, Z_2, Z_3, Z_4, Z_5, Z_6, D\} \).

If the equality \( D_1' = \{Z_1, Z_2, Z_3, Z_4, Z_5, Z_6, Z_7, Z_8\} \) is fulfilled, then \( R^*(Q_13) = R(D_1') \) (see definition 1.4) and

\[
|R^*(Q_13)| = |R(D_1')| \quad (3.7)
\]

**Lemma 3.5.** Let \( D = \{Z_1, Z_2, Z_3, Z_4, Z_5, Z_6, Z_7, Z_8\} \subseteq \Sigma (x, 8) \), \( Z_1 \cap Z_3 = \emptyset, Z_4 \cap Z_5 \neq \emptyset \). If \( X \) is a finite set, then

\[
|R^*(Q_13)| = (2^{p-x_1} - 1) \cdot 6^{p-x_1}
\]

**Proof:** As is well known \( |\Phi(Q_13, Q_13)| = 1 \) (see [7]) and \( |\Omega(Q_13)| = 1 \), then by equality (3.7) and by statement 13) of Lemma 1.1 we obtain the validity of Lemma 3.5.

The Lemma is proved.

14) Let binary relation \( \alpha \) of the semigroup \( B_x (D) \) satisfying the condition 14) of the Theorem 3.1. In this case we have that \( Q_{14} = \{Z_1, Z_2, Z_3, Z_4, Z_5, Z_6, D\} \).

If the equality \( D_1' = \{Z_1, Z_2, Z_3, Z_4, Z_5, Z_6, Z_7, Z_8\} \) is fulfilled, then \( R^*(Q_14) = R(D_1') \) (see definition 1.4) and

\[
|R^*(Q_14)| = |R(D_1')| \quad (3.8)
\]

**Lemma 3.6.** Let \( D = \{Z_1, Z_2, Z_3, Z_4, Z_5, Z_6, Z_7, Z_8\} \subseteq \Sigma (x, 8) \), \( Z_1 \cap Z_3 = \emptyset, Z_4 \cap Z_5 \neq \emptyset \). If \( X \) is a finite set, then

\[
|R^*(Q_14)| = (2^{p-x_1} - 1) \cdot (6^{p-x_1} - 5^{p-x_1}) \cdot 6^{p-x_1}
\]

**Proof:** As is well known \( |\Phi(Q_14, Q_14)| = 1 \) (see [7]) and \( |\Omega(Q_14)| = 1 \), then by equality (3.8) and by statement 14) of Lemma 1.1 we obtain the validity of Lemma 3.6.

The Lemma is proved.

15) Let binary relation \( \alpha \) of the semigroup \( B_x (D) \) satisfying the condition 15) of the Theorem 3.1. In this case we have that \( Q_{15} = \{Z_1, Z_2, Z_3, Z_4, Z_5, Z_6, D\} \).
If the equality $D'_i = \{Z_1, Z_2, Z_4, Z_5, Z_6, Z_7, D_i\}$ is fulfilled, then $R' (Q_{i3}) = R(D'_i)$ (see definition 1.4) and
\[ R^* (Q_{i3}) = |R(D'_i)| \tag{3.9} \]

**Lemma 3.7.** Let $D = \{Z_1, Z_2, Z_4, Z_5, Z_6, Z_7, D\} \in \Sigma_1 (X, 8)$, $Z_1 \cap Z_2 = \emptyset$, $Z_6 \cap Z_7 \neq \emptyset$. If $X$ is a finite set, then
\[ |R^* (Q_{i1})| = |R(D)| \]

**Proof:** As is well known $|\phi(Q_{i3}, Q_{i3})| = 1$ (see definition 1.4) and satisfies the conditions: $|\phi(Q_{i3}, Q_{i3})| = 1$, then by equality (3.9) and by statement 15) of Lemma 1.1 we obtain the validity of Lemma 3.7.

The Lemma is proved.

Let $X$ is a finite set and we assume that
\[ r_5 = |R^* (Q_{i2})| + |R^* (Q_{i3})| + |R^* (Q_{i4})| + |R^* (Q_{i5})| + |R^* (Q_{i5})| = \]
\[ = 4 \cdot 3^{2(0)} + 4 \cdot (4^{2(0)} - 3^{2(0)}), 3^{2(0)} + 4 \cdot (4^{2(0)} - 3^{2(0)}), 3^{2(0)} + 4 \cdot (4^{2(0)} - 3^{2(0)}), 3^{2(0)} + 4 \cdot (4^{2(0)} - 3^{2(0)}), 3^{2(0)} + 4 \cdot (4^{2(0)} - 3^{2(0)}), 3^{2(0)} \]
\[ + 4 \cdot (4^{2(0)} - 3^{2(0)}), 3^{2(0)} + 4 \cdot (4^{2(0)} - 3^{2(0)}), 3^{2(0)} + 4 \cdot (4^{2(0)} - 3^{2(0)}), 3^{2(0)} + 4 \cdot (4^{2(0)} - 3^{2(0)}), 3^{2(0)} + 4 \cdot (4^{2(0)} - 3^{2(0)}), 3^{2(0)} \]
\[ + 4 \cdot (4^{2(0)} - 3^{2(0)}), 3^{2(0)} + 4 \cdot (4^{2(0)} - 3^{2(0)}), 3^{2(0)} + 4 \cdot (4^{2(0)} - 3^{2(0)}), 3^{2(0)} + 4 \cdot (4^{2(0)} - 3^{2(0)}), 3^{2(0)} + 4 \cdot (4^{2(0)} - 3^{2(0)}), 3^{2(0)} \]

\((|R^* (Q_{i1})|)\) and \(|R^* (Q_{i2})|\) see in the Lemma 2.6 and Lemma 2.7 respectively).

**Theorem 3.2.** Let $D = \{Z_1, Z_2, Z_4, Z_5, Z_6, Z_7, D\} \in \Sigma_1 (X, 8)$, $Z_1 \cap Z_2 = \emptyset$, $Z_6 \cap Z_7 \neq \emptyset$. If $X$ is a finite set and $R_0$ is a set of all regular elements of the semigroup $B_x(D)$, then $|R_0| = r_5 + r_5$.

**Proof:** This Theorem immediately follows from the Theorem 3.1.

The Theorem is proved.

**Example 3.1.** Let $X = \{1,2,3,4,5\}$,
\[ P_0 = \emptyset, P_1 = \{1\}, P_2 = \{2\}, P_3 = \{3\}, P_4 = \emptyset, P_5 = \{2,4\}, P_6 = \{3\} \]

Then $D = \{1,2,3,4,5\}, Z_1 = \{2,3,4,5\}, Z_2 = \{1,3,4,5\}, Z_3 = \{2,4,5\}, Z_4 = \{3,4,5\}, Z_5 = \{1,3,5\}, Z_6 = \{4,5\}, Z_7 = \{3\}$ and
\[ D = \{[3], [4,5], [1,3,5], [3,4,5], [2,4,5], [1,3,4,5], [2,3,4,5], [1,2,3,4,5] \}

Therefore we have that following equality and inequality is valid:
\[ Z_1 \cap Z_2 = \emptyset, Z_7 \cap Z_3 = \emptyset, Z_6 \cap Z_7 = \emptyset, \]
\[ Z_1 \cap Z_4 = \emptyset, Z_2 \cap Z_3 = \emptyset, Z_4 \cap Z_5 = \emptyset, Z_5 \cap Z_6 = \emptyset, \]
\[ Z_2 \cap Z_7 = \emptyset, Z_4 \cap Z_6 = \emptyset, Z_5 \cap Z_7 = \emptyset \]

Where
\[ |R^* (Q_{i1})| = 8, |R^* (Q_{i2})| = 361, |R^* (Q_{i3})| = 612, |R^* (Q_{i4})| = 72, |R^* (Q_{i5})| = 126, |R^* (Q_{i6})| = 16, |R^* (Q_{i7})| = 8, \]
\[ |R^* (Q_{i8})| = 4, |R^* (Q_{i9})| = 36, |R^* (Q_{i10})| = 56, |R^* (Q_{i11})| = 8, |R^* (Q_{i12})| = 4, |R^* (Q_{i13})| = 5, |R^* (Q_{i14})| = 1, |R^* (Q_{i15})| = 1, |R^* (Q_{i16})| = 1318. \]

**Theorem 4.1.** Let $D = \{Z_1, Z_2, Z_3, Z_4, Z_5, Z_6, Z_7, D\} \in \Sigma_1 (X, 8)$, $Z_6 \cap Z_7 = \emptyset$ and $Z_1 \cap Z_2 \neq \emptyset$. Then a binary relation $\alpha$ of the semigroup $B_x(D)$ that has a quasinormal representation of the form to be given below is a regular element of this semigroup iff there exist a complete $\alpha$-isomorphism $\phi$ of the semilattice $V(D, \alpha)$ on some subsemilattice $D'$ of the semilattice $D$ that satisfies at least one of the Theorem 2.1 and only one following conditions:

9) $\alpha = \{Y_i \times X\} \cup \{Y_i \times X\}$, where $T,T' \in D, T \cap T' \neq \emptyset$, $T \cap T' \neq \emptyset$, $Y_i \neq Y_i$, $Y_i \neq Y_i$ and satisfies the conditions: $Y_i \neq \emptyset(T'), Y_i \neq \emptyset(T')$;

10) $\alpha = \{Y_i \times X\} \cup \{Y_i \times X\} \cup \{Y_i \times X(T \cap T')\}$, where $T,T' \in D, T \cap T' \neq \emptyset$, $T \cap T' \neq \emptyset$, $Y_i \neq Y_i$, $Y_i \neq Y_i$ and satisfies the conditions: $Y_i \neq \emptyset(T'), Y_i \neq \emptyset(T')$, $Y_i \neq \emptyset(T') \neq \emptyset$;

13) $\alpha = \{Y_i \times Z_i\} \cup \{Y_i \times Z_i\} \cup \{Y_i \times Z_i\} \cup \{Y_i \times Z_i\}$, where $Y_i \neq Y_i$, $Y_i \neq Y_i$ and satisfies the conditions: $Y_i \neq \emptyset(Z_i), Y_i \neq \emptyset(Z_i)$, $Y_i \neq \emptyset(Z_i)$, $Y_i \cap \emptyset(Z_i) \neq \emptyset$. 

14) \( a = \left( Y_a^r \times Z_a \right) \cup \left( Y_a^s \times Z_a \right) \cup \left( Y_a^t \times Z_a \right) \cup \left( Y_a^u \times Z_a \right) \cup \left( Y_a^v \times D_a \right) \), where \( Y_a^r, Y_a^s, Y_a^t, Y_a^u \not\in \{ \emptyset \} \) and satisfies the conditions: \( Y_a^r \supseteq \phi(Z_a), \ Y_a^s \supseteq \phi(Z_a), \ Y_a^t \supseteq \phi(Z_a), \ Y_a^u \cap \phi(Z_a) \neq \emptyset, \ Y_a^v \cap \phi(D_a) \neq \emptyset. \)

15) \( a = \left( Y_a^r \times Z_a \right) \cup \left( Y_a^s \times Z_a \right) \cup \left( Y_a^t \times Z_a \right) \cup \left( Y_a^u \times Z_a \right) \cup \left( Y_a^v \times Z_a \right) \cup \left( Y_a^w \times Z_a \right) \cup \left( Y_a^x \times Z_a \right) \cup \left( Y_a^y \times D_a \right) \), where \( Y_a^r, Y_a^s, Y_a^t, Y_a^u \not\in \{ \emptyset \} \) and satisfies the conditions: \( Y_a^r \supseteq \phi(Z_a), \ Y_a^s \supseteq \phi(Z_a), \ Y_a^t \supseteq \phi(Z_a), \ Y_a^u \cup Y_a^v \cup Y_a^w \cup Y_a^x \supseteq \phi(Z_a), \ Y_a^y \cap \phi(Z_a) \neq \emptyset, \ Y_a^x \cap \phi(D_a) \neq \emptyset. \)

**Proof.** In this case, when \( Z_a \cap Z_i = \emptyset \) and \( Z_i \cap Z_j \neq \emptyset \), from the Lemma 2.6 in [7] it follows that diagrams 1-15 given in fig.1 exhibit all forms of the semilattices \( D_a \), a quasinormal representation of regular elements of the semigroup \( B_a(D) \), which are defined by these -semilattices, may have one of the forms listed above. The statements 9), 10) immediately follows from the Theorem 13.2.1 in [1], the statements 13), 14) immediately follows from the Theorem 13.4.1 in [1], 13.4.1 in [2], the statement 15) immediately follows from the Theorem 13.10.1 in [1].

The Theorem is proved.

9. Let binary relation \( \alpha \) of the semigroup \( B_a(D) \) satisfying the condition 9) of the Theorem 4.1. In this case we have that \( Q_{\alpha} = \{ Z_a \cup \{ Z_1, Z_2, Z_3 \} \} \).

If the equalities \( D_1 = \{ Z_a, Z_b, Z_c, Z_d, Z_e, Z_f \}, D_2 = \{ Z_a, Z_b, Z_c, Z_d \}, D_3 = \{ Z_a, Z_b, Z_c, Z_d, Z_e \} \) are fulfilled, then

\[ R^*(Q_{\alpha}) = R(D_1) \cup R(D_2) \cup R(D_3) \cup R(D_4) \quad (4.1) \]

(see Definition 1.4).

**Lemma 4.1.** Let \( D = \{ Z_a, Z_b, Z_c, Z_d, Z_e, Z_f, Z_g, D_1 \} \in \Sigma(X, \emptyset) \), \( Z_a \cap Z_b = \emptyset, \ Z_b \cap Z_c \neq \emptyset \). If \( X \) is a finite set and by \( |R^*(Q_{\alpha})| \) denoted all regular elements of the semigroup \( B_a(D) \) satisfying the condition 9) of the Theorem 4.1, then

\[ |R^*(Q_{\alpha})| = |R(D_1)| + |R(D_2)| \]

**Proof:** Let \( \alpha \in R(D_1) \), then quasinormal representation of a binary relation \( \alpha \) has form \( \alpha = \left( Y_a^r \times T \right) \cup \left( Y_a^s \times T' \right) \cup \left( Y_a^t \times (T \cup T') \right) \) for some \( T \cap T' \neq \emptyset \), \( T \cap T' \neq \emptyset \), \( T', T' \in D \), \( Y_a^r, Y_a^s \not\in \{ \emptyset \} \) and by statement 9) of the theorem 4.1 satisfies the conditions \( Y_a^r \supseteq Z_a, Y_a^s \supseteq Z_a \). By definition of the semilattice \( D \) we have \( Z_a \supseteq Z_b \) and \( Z_a \supseteq Z_c \). Of this we have: \( Y_a^r \supseteq Z_a \), \( Y_a^s \supseteq Z_a \), i.e. \( \alpha \in R(D_1) \). It follows that \( R(D_1) \subseteq R(D) \). Of this we have \( R(D_1) \subseteq R(D_2) \).

Therefore by the equality (4.1) we have

\[ R^*(Q_{\alpha}) = R(D_1) \cup R(D_2) \quad (4.2) \]

Now we show that the following equality is true:

\[ R(D_1) \cap R(D_2) = \emptyset \quad (4.3) \]

If \( \alpha \in R(D_1) \cap R(D_2) \), then

\[ Y_a^r \supseteq Z_a, Y_a^s \supseteq Z_a, \]

\[ Y_a^r \supseteq Z_a, Y_a^s \supseteq Z_a, \]

It follows that \( Y_a^r \supseteq Z_a \cup Z_b = Z_a, Y_a^s \supseteq Z_a \cup Z_c = Z_a \), and \( Y_a^r \cap Y_a^s \supseteq Z_a \cup Z_b \neq \emptyset \), but the inequality \( Y_a^r \cap Y_a^s \neq \emptyset \) contradiction of the condition that representation of binary relation \( \alpha \) is quasinormal.

So, the equality \( R(D_1) \cap R(D_2) = \emptyset \) is hold.

Now by the equalities of (4.2) and (4.3) immediately follows that the following equality is true

\[ |R^*(Q_{\alpha})| = |R(D_1)| + |R(D_2)| \]

The Lemma is proved.

**Lemma 4.2.** Let \( D = \{ Z_a, Z_b, Z_c, Z_d, Z_e, Z_f, D_1 \} \in \Sigma(X, \emptyset) \), \( Z_a \cap Z_b = \emptyset, Z_a \cap Z_c \neq \emptyset \). If \( X \) is a finite set, then

\[ |R^*(Q_{\alpha})| = 4 \cdot 3^{\text{finite}} \]
Proof: As is well known \( \| \Phi(Q_0, Q_0) \| = 2 \) (see [7]) and \( \| \Omega(Q_0) \| = 2 \), then by Lemma 4.1 and by statement 9) of Lemma 1.1 we obtain the validity of Lemma 4.2.

The Lemma is proved.

10. Let binary relation \( \alpha \) of the semigroup \( B_x(D) \) satisfying the condition 10) of the Theorem 4.1. In this case we have that

\[
Q_0 \partial_{D_x} = \left\{ \{Z_7, Z_6, Z_4, D\}, \{Z_7, Z_6, Z_4, Z_2\}, \{Z_7, Z_6, Z_4, Z_1\}, \{Z_6, Z_5, Z_2, D\} \right\}
\]

If the equalities

\[
D'_r = \{Z_7, Z_6, Z_4, D\}, \quad D'_s = \{Z_7, Z_6, Z_4, D\}, \quad D'_r = \{Z_7, Z_6, Z_4, Z_2\}, \quad D'_s = \{Z_7, Z_6, Z_4, Z_1\},
\]

are fulfilled, then

\[
R^*(Q_0) = \bigcup_{i=1}^{8} R(D'_i)
\]  

(4.4)

(see Definition 1.4).

Lemma 5.4.3. Let \( D = \{Z_7, Z_6, Z_4, Z_2, Z_1\} \in \Sigma(X, 8) \), \( Z_6 \cap Z_5 = \emptyset \), \( Z_7 \cap Z_3 \neq \emptyset \). If \( X \) is a finite set and by \( R^*(Q_0) \) denoted all regular elements of the semigroup \( B_x(D) \) satisfying the condition 10) of the Theorem 4.1, then

\[
\left| R^*(Q_0) \right| = \left| R(D'_1) \right| + \left| R(D'_2) \right|
\]

Proof. Let \( \alpha \in R(D'_r) \), then quasinormal representation of a binary relation \( \alpha \) has form

\[
\alpha = (Y'_r \times T_1) \cup (Y'_s \times T_2) \cup \left( Y'_r \times (T \cap T') \right) \cup (Y'_s \times T'')
\]

for some \( T, T', T'' \in D \), \( T \cap T' \neq \emptyset \), \( T \cap T'' \neq \emptyset \), \( T \cup T' \subset T'' \), \( Y'_r, Y'_s, Y'_r \notin \{ \emptyset \} \) and by statement 10) of the theorem 4.1 satisfies the conditions

\[
Y'_r \supseteq Z_7, \quad Y'_s \supseteq Z_6, \quad Y'_r \cap Z_3 \neq \emptyset.
\]

By definition of the semilattice \( D \) we have \( Z_7 \supseteq Z_7 \) or \( Z_6 \supseteq Z_6 \) and \( D \supseteq Z_2 \), therefore:

\[
Y'_r \supseteq Z_7, \quad Y'_s \supseteq Z_6, \quad Y'_r \cap Z_3 \neq \emptyset
\]

i.e. \( \alpha \in R(D'_i) \). Of this we have

\[
R(D'_1) \subseteq R(D'_i), \quad R(D'_s) \subseteq R(D'_i), \quad R(D'_r) \subseteq R(D'_i), \quad R(D'_s) \subseteq R(D'_i)
\]

By the equality (4.4) we have

\[
R^*(Q_0) = R(D'_1) \cup R(D'_2)
\]  

(4.5)

Now we show that the following equality is true:

\[
R(D'_1) \cap R(D'_2) = \emptyset
\]  

(4.6)

If \( \alpha \in R(D'_1) \cap R(D'_2) \), then

\[
Y'_r \supseteq Z_7, \quad Y'_s \supseteq Z_6, \quad Y'_r \cap Y'_s \supseteq Z_4, \quad Y'_s \cap D \neq \emptyset, \quad Y'_r \supseteq Z_7, \quad Y'_s \supseteq Z_6, \quad Y'_s \cap D \neq \emptyset.
\]

It follows that \( Y'_r \supseteq Z_7 \) or \( Z_6 \) and \( Y'_r \cap Y'_s \supseteq Z_4 \) or \( Y'_r \cap D \neq \emptyset \), but the inequality \( Y'_r \cap Y'_s \neq \emptyset \) contradicts the condition that representation of binary relation \( \alpha \) is quasinormal. So, the equality \( R(D'_1) \cap R(D'_2) = \emptyset \) is hold.

Now by the equalities of (4.5) and (4.6) immediately follows that the following equality is true

\[
\left| R^*(Q_0) \right| = \left| R(D'_1) \right| + \left| R(D'_2) \right|
\]

The Lemma is proved.

Lemma 4.4. Let \( D = \{Z_7, Z_6, Z_4, Z_2, Z_1\} \in \Sigma(X, 8) \), \( Z_6 \cap Z_5 = \emptyset \), \( Z_7 \cap Z_3 \neq \emptyset \). If \( X \) is a finite set, then

\[
\left| R^*(Q_0) \right| = 8 \cdot \left| \Phi^0 \cdot D \right| - 3 \cdot \left| \Phi^0 \cdot D \right|
\]

Proof: As is well known \( \| \Phi(Q_0, Q_0) \| = 2 \) (see [7]) and \( \| \Omega(Q_0) \| = 4 \), then by Lemma 4.3 and by statement 10) of Lemma 1.1 we obtain the validity of Lemma 4.4. The Lemma is proved.
13) Let binary relation $\alpha$ of the semigroup $B_4(D)$ satisfying the condition 13) of the Theorem 3.1. In this case we have that $Q_{13} = \{\{Z_7, Z_6, Z_5, Z_4, Z_2\}\}$. 

If the equality $D'_1 = \{Z_7, Z_6, Z_5, Z_4, Z_2\}$ is fulfilled, then $R^*(Q_{13}) = R(D'_1)$ (see definition 1.4) and 

$$R^*(Q_{13}) = |R(D'_1)|$$ (4.7)

**Lemma 4.5.** Let $D = \{Z_7, Z_6, Z_5, Z_4, Z_2, Z_1\} \in \Sigma_1\{X, Y\}, \ Z_6 \cap Z_5 = \emptyset, Z_7 \cap Z_3 \neq \emptyset$. If $X$ is a finite set, then 

$$|R^*(Q_{13})| = (2^{k_1} - 1) \cdot 3^{k_1}$$

**Proof:** As is well known $\Phi(Q_{13}, Q_{13}) = 1$ (see [7]) and $\Omega(Q_{13}) = 1$, then by equality (4.7) and by statement 13) of Lemma 1.1 we obtain the validity of Lemma 4.5.

The Lemma is proved.

14) Let binary relation $\alpha$ of the semigroup $B_4(D)$ satisfying the condition 14) of the Theorem 4.1. In this case we have that $Q_{14} = \{\{Z_7, Z_6, Z_5, Z_4, Z_2\}\}$. 

If the equality $D'_1 = \{Z_7, Z_6, Z_5, Z_4, Z_2\}$ is fulfilled, then $R^*(Q_{14}) = R(D'_1)$ (see definition 1.4) and 

$$R^*(Q_{14}) = |R(D'_1)|$$ (4.8)

**Lemma 4.6.** Let $D = \{Z_7, Z_6, Z_5, Z_4, Z_2, Z_1\} \in \Sigma_1\{X, Y\}, \ Z_6 \cap Z_5 = \emptyset, Z_7 \cap Z_3 \neq \emptyset$. If $X$ is a finite set, then 

$$|R^*(Q_{14})| = (2^{k_1} - 1) \cdot 3^{k_1} \cdot 3^{k_1}$$

**Proof:** As is well known $\Phi(Q_{14}, Q_{14}) = 1$ (see [7]) and $\Omega(Q_{14}) = 1$, then by equality (4.8) and by statement 14) of Lemma 1.1 we obtain the validity of Lemma 4.6.

The Lemma is proved.

15) Let binary relation $\alpha$ of the semigroup $B_4(D)$ satisfying the condition 15) of the Theorem 4.1. In this case we have that $Q_{15} = \{\{Z_7, Z_6, Z_5, Z_4, Z_2\}\}$. 

If the equality $D'_1 = \{Z_7, Z_6, Z_5, Z_4, Z_2, Z_1\}$ is fulfilled, then $R^*(Q_{15}) = R(D'_1)$ (see definition 1.4) and 

$$R^*(Q_{15}) = |R(D'_1)|$$ (4.9)

**Lemma 4.7.** Let $D = \{Z_7, Z_6, Z_5, Z_4, Z_2, Z_1\} \in \Sigma_1\{X, Y\}, \ Z_6 \cap Z_5 = \emptyset, Z_7 \cap Z_3 \neq \emptyset$. If $X$ is a finite set, then 

$$|R^*(Q_{15})| = (2^{k_1} - 1) \cdot 3^{k_1} \cdot 3^{k_1} \cdot 3^{k_1}$$

**Proof:** As is well known $\Phi(Q_{15}, Q_{15}) = 1$ (see [7]) and $\Omega(Q_{15}) = 1$, then by equality (4.9) and by statement 15) of Lemma 1.1 we obtain the validity of Lemma 4.7.

The lemma is proved.

Let $X$ is a finite set and we assume that 

$$r_s = |R^*(Q_{15})|$$

$$|R^*(Q_{15})| = (2^{k_1} - 1) \cdot 3^{k_1} \cdot 3^{k_1} \cdot 3^{k_1}$$

(see in the Lemma 2.6 and Lemma 2.7 respectively).

**Theorem 4.2.** Let $D = \{Z_7, Z_6, Z_5, Z_4, Z_2\} \in \Sigma_1\{X, Y\}, \ Z_6 \cap Z_5 = \emptyset, Z_7 \cap Z_3 \neq \emptyset$. If $X$ is a finite set and $R_0$ is a set of all regular elements of the semigroup $B_4(D)$, then $|\mathcal{R}| = r_s + r_1$.

**Proof:** This Theorem immediately follows from the Theorem 4.1.

The Theorem is proved.

**Example 4.1.** Let $X = \{1, 2, 3, 4, 5\}$, 

$$P_0 = \{\emptyset\}, P_1 = \{1\}, P_2 = \{2\}, P_3 = \{3\}, P_4 = \{4\}, P_5 = \{5\}, P_6 = \{\emptyset\}.$$
Then \( D = \{1,2,3,4,5\}, \ Z = \{2,3,4,5\}, \ Z = \{1,3,4,5\}, \ Z = \{2,4,5\}, \ Z = \{3,4,5\}, \ Z = \{1,3,5\}, \ Z = \{4\}, \ Z = \{3,5\}\) and 
\[ D = \{(3,5), (4), \{3,5\}, \{3,4,5\}, \{2,4,5\}, \{1,3,4,5\}, \{2,3,4,5\}, \{1,2,3,4,5\}\}. \]

Therefore we have that following equality and inequality is valid:
\[ Z \cap Z = \{3\} \cap \{4\} = \emptyset, \]
\[ Z \cap Z = \{4\} \cap \{1,3,5\} = \emptyset, \]
\[ Z \cap Z = \{3,5\} \cap \{2,4,5\} = \{5\} \neq \emptyset, \]
where \( |R(Q)| = 8, \ |R(Q)| = 361, \ |R(Q)| = 612, \ |R(Q)| = 72, \ |R(Q)| = 16, \ |R(Q)| = 8, \ |R(Q)| = 4, \ |R(Q)| = 36, \ |R(Q)| = 56, \ |R(Q)| = 8, \ |R(Q)| = 4, \ |R(Q)| = 5, \ |R(Q)| = 1, \ |R(Q)| = 1, \ |R_Q| = 1318. \]

**Theorem 5.1.** Let \( D = \{Z_1, Z_2, Z_3, Z_4, Z_5, Z_6, Z_7, Z_8\} \subseteq \{X, Y\}, \ Z_6 \cap Z_7 = \emptyset, \ Z_7 \cap Z_3 = \emptyset\) and \( Z_7 \cap Z_3 \neq \emptyset\). Then a binary relation \( \alpha \) of the semigroup \( B_4(D) \) that has a quasinormal representation of the form to be given below is a regular element of this semigroup if\( f\) there exist a complete \( \alpha - \) isomorphism \( \phi \) of the semilattice \( V(D, \alpha) \) on some subsemilattice \( D' \) of the semilattice \( D \) that satisfies at least one of the Theorem 2.1 and only one following conditions:

9) \( \alpha = (Y_7 \times X) \cup \left(Y_7 \times X \cup (T \times T') \right) \), where \( T, T' \in D, \ T \setminus T \neq \emptyset, \ T \setminus T \neq \emptyset, \ Y_7, Y_7 \notin \{\emptyset\} \) and satisfies the conditions: \( Y_7, Y_7 \subseteq \phi(T), \ Y_7, Y_7 \subseteq \phi(T) \); 

10) \( \alpha = (Y_7 \times X) \cup \left(Y_7 \times X \cup (T \times T') \right) \cup \left(Y_7 \times X \right), \) where \( T, T' \in D, \ T \setminus T \neq \emptyset, \ T \setminus T \neq \emptyset, \ Y_7, Y_7 \notin \{\emptyset\} \) and satisfies the conditions: \( Y_7, Y_7 \subseteq \phi(T), \ Y_7, Y_7 \subseteq \phi(T) \); 

13) \( \alpha = (Y_7 \times X) \cup \left(Y_7 \times X \cup (T \times T') \right) \cup \left(Y_7 \times X \right), \) where \( T, T', T', Z \in D, \ T \setminus T \subseteq T, \ T \setminus T \subseteq T, \ T \setminus T \subseteq T, \ T \setminus T \subseteq T, \ T \setminus T \subseteq T, \ T \setminus T \subseteq T, \ T \setminus T \subseteq T, \ T \setminus T \subseteq T, \ Y_7, Y_7 \notin \{\emptyset\} \) and satisfies the conditions: \( Y_7, Y_7 \subseteq \phi(T), \ Y_7, Y_7 \subseteq \phi(T) \); 

14) \( \alpha = (Y_7 \times X) \cup \left(Y_7 \times X \cup (T \times T') \right) \cup \left(Y_7 \times X \right), \) where \( T, T', T', Z \in D, \ Z \subseteq Z, \ Z \subseteq Z, \ Z \subseteq Z, \ T \setminus T \subseteq T, \ T \setminus T \subseteq T, \ T \setminus T \subseteq T, \ T \setminus T \subseteq T, \ Y_7, Y_7 \notin \{\emptyset\} \) and satisfies the conditions: \( Y_7, Y_7 \subseteq \phi(T), \ Y_7, Y_7 \subseteq \phi(T) \); 

15) \( \alpha = (Y_7 \times Z) \cup \left(Y_7 \times Z \cup (T \times T') \right) \cup \left(Y_7 \times Z \right), \) where \( T, T', T', Z \in D, \ T \subseteq T, \ T \subseteq T, \ T \subseteq T, \ T \subseteq T, \ T \subseteq T, \ T \subseteq T, \ Z \subseteq Z, \ Z \subseteq Z, \ Y_7, Y_7 \notin \{\emptyset\} \) and satisfies the conditions: \( Y_7, Y_7 \subseteq \phi(T), \ Y_7, Y_7 \subseteq \phi(T) \); 

Proof. In this case, when \( Z \cap Z = \emptyset, \ Z \cap Z = Z \cap Z = \emptyset, \ Z \cap Z = \emptyset, \) from the Lemma 2.7 in [7] it follows that diagrams 1-15 given in fig.1 exhibit all diagrams of \( \chi_1\) - subsemilattices of the semilattices \( D \), a quasinormal representation of regular elements of the semigroup \( B_4(D) \) which are defined by these \( \chi_1\) - semilattices, may have one of the forms listed above. The statements 9), 10) immediately follows from the Theorem 13.2.1 in [1], 13.2.1 in [2], the statements immediatly follows from the Theorem 13.4.1 in [1], 13.4.1 in [2], the statement immediately follows from the Theorem 13.10.1 in [1].

The Theorem is proved.

9. Let binary relation \( \alpha \) of the semigroup \( B_4(D) \) satisfying the condition 9) of the Theorem 5.1. In this case we have that 
\[ Q_0 \beta = \{(Z_1, Z_2, Z_4), (Z_1, Z_3, Z_1), (Z_6, Z_3, Z_2)\} \]
If the equalities
\[
D' = \{Z_7, Z_6, Z_4\}, \quad D'_2 = \{Z_6, Z_7, Z_4\}, \quad D'_3 = \{Z_6, Z_5, Z_1\}, \\
D'_4 = \{Z_3, Z_7, Z_1\}, \quad D'_5 = \{Z_6, Z_3, Z_2\}, \quad D'_6 = \{Z_3, Z_5, Z_2\}
\]
are fulfilled, then
\[
R^*(Q_8) = R(D'_1) \cup R(D'_2) \cup R(D'_3) \cup R(D'_4) \cup R(D'_5) \cup R(D'_6)
\]
(see Definition 1.4).

**Lemma 5.1.** Let \( D = (Z_7, Z_6, Z_5, Z_4, Z_3, Z_2, Z_1, D) \in \Sigma_1(X, \delta) \), \( Z_7 \cap Z_8 = \emptyset \), \( Z_7 \cap Z_3 = \emptyset \) and \( Z_5 \cap Z_3 = \emptyset \). If \( X \) is a finite set and by \( R^*(Q_8) \) denoted all regular elements of the semigroup \( B_4(D) \) satisfying the condition 9) of the Theorem 5.1, then
\[
|R^*(Q_8)| = |R(D'_1)| + |R(D'_2)|
\]
(5.1)

**Proof:** Let \( \alpha \in R(D'_1) \), then quasinormal representation of a binary relation \( \alpha \) has form
\[
\alpha = (Y''_\alpha \times T') \cup (Y''_\alpha \times (T \cup T')) \text{ for some } T \setminus T' \neq \emptyset, \ T \setminus T \neq \emptyset, \ T, T' \in D, \ Y''_\alpha, Y''_\alpha \notin \{\emptyset\} \text{ and by statement 9) of the theorem 5.1 satisfies the conditions } Y''_\alpha \supseteq Z_7, \ Y''_\alpha \supseteq Z_3. \text{ By definition of the semilattice } D \text{ we have } Z_7 \supseteq Z_7 \text{ and } Z_7 \supseteq Z_7. \text{ Of this we have: } Y''_\alpha \supseteq Z_7, \ Y''_\alpha \supseteq Z_7, \ i.e. \alpha \in R(D'_1). \text{ It follows that } R(D'_1) \subseteq R(D'_1). \text{ Of this we have } R(D'_1) \subseteq R(D'_1), \ R(D'_1) \subseteq R(D'_1), \ R(D'_1) \subseteq R(D'_1).

Therefore by the equality (5.1) we have
\[
R^*(Q_8) = R(D'_1) \cup R(D'_1)
\]
(5.2)

Now we show that the following equality is true:
\[
R(D'_1) \cap R(D'_1) = \emptyset
\]
(5.3)

If \( \alpha \in R(D'_1) \cap R(D'_1) \), then
\[
Y''_\alpha \supseteq Z_7, \ Y''_\alpha \supseteq Z_3,
\]
\[
Y''_\alpha \supseteq Z_7, \ Y''_\alpha \supseteq Z_7.
\]

It follows that \( Y''_\alpha \supseteq Z_7 \cup Z_7 = Z_7, \ Y''_\alpha \supseteq Z_7 \cup Z_3 = Z_3 \) and \( Y''_\alpha \cap Y''_\alpha \supseteq Z_4 \cup Z_4 = \emptyset \), but the inequality \( Y''_\alpha \cap Y''_\alpha \neq \emptyset \) contradicts the condition that representation of binary relation \( \alpha \) is quasinormal. So, the equality \( R(D'_1) \cap R(D'_1) = \emptyset \) is hold.

Now by the equalities of (5.2) and (5.3) immediately follows that the following equality is true
\[
|R^*(Q_8)| = |R(D'_1)| + |R(D'_1)|
\]
(5.4)

The Lemma is proved.

**Lemma 5.2.** Let \( D = (Z_7, Z_6, Z_5, Z_4, Z_3, Z_2, Z_1, D) \in \Sigma_1(X, \delta) \), \( Z_7 \cap Z_8 = \emptyset \), \( Z_7 \cap Z_3 = \emptyset \) and \( Z_5 \cap Z_3 = \emptyset \). If \( X \) is a finite set, then
\[
|R^*(Q_8)| = 6 \cdot 3^{k-1}
\]
(5.5)

**Proof:** As is well known \( |\Phi(Q_8, Q_8)| = 2 \) (see [7]) and \( |\Omega(Q_8)| = 3 \), then by Lemma 5.1 and by statement 9) of Lemma 1.1 we obtain the validity of Lemma 5.2.

The Lemma is proved.

**10.** Let binary relation \( \alpha \) of the semigroup \( B_4(D) \) satisfying the condition 10) of the Theorem 5.1. In this case we have that
\[
Q_{10} = \{\{Z_7, Z_6, Z_4, D\}, \{Z_7, Z_6, Z_4, D\}, \{Z_7, Z_6, Z_4, D\}, \{Z_7, Z_6, Z_4, D\}, \{Z_7, Z_6, Z_4, D\}, \{Z_5, Z_6, Z_2, D\}, \{Z_3, Z_5, Z_2, D\}
\]
If the equalities
\[
D'_1 = \{Z_7, Z_6, Z_4, D\}, \quad D'_2 = \{Z_7, Z_6, Z_4, D\}, \quad D'_3 = \{Z_7, Z_6, Z_4, D\}, \\
D'_4 = \{Z_7, Z_6, Z_4, D\}, \quad D'_5 = \{Z_7, Z_6, Z_4, D\}, \quad D'_6 = \{Z_7, Z_6, Z_4, D\}
\]
are fulfilled, then
\[
R^*(Q_{10}) = \bigcup_{i=1}^{10} R(D'_i)
\]
(5.4)

(see Definition 1.4).
Lemma 5.3. Let \( D = \{Z_1, Z_2, Z_3, Z_4, Z_5, Z_6, Z_7, Z_8, \} \in \Sigma_2(X,8), \quad Z_6 \cap Z_7 = \emptyset, \quad Z_7 \cap Z_8 = \emptyset \) and \( Z_5 \cap Z_8 \neq \emptyset \). If \( X \) be a finite set and by \( R'(Q_{0}) \) denoted all regular elements of the semigroup \( B_x(D) \) satisfying the condition 10) of the Theorem 5.1, then

\[
R'(Q_{0}) = R(D'_1) \cup R(D'_2)
\]

Proof. Let \( \alpha \in R(D'_1) \), then quasinormal representation of a binary relation \( \alpha \) has form

\[
\alpha = (Y''_1 \times T) \cup (Y''_2 \times T) \cup (Y''_3 \times T \cup T') \cup (Y''_4 \times T')
\]

for some \( T, T', T'' \in D, \ T \setminus T' \neq \emptyset, \ T \cup T' \subseteq T'', \ Y''_1, Y''_2, Y''_3, Y''_4 \neq \emptyset \) and by statement 10) of the theorem 4.1 satisfies the conditions \( Y''_1 \supseteq Z_7, \ Y''_2 \supseteq Z_8, \ Y''_3 \supseteq Z_7, \ Y''_4 \supseteq Z_8 \). By definition of the semilattice \( D \) we have \( Z_7 \supseteq Z_6 \), or \( Z_8 \supseteq Z_6 \), and \( D \supseteq Z_2 \), therefore:

\[
Y''_1 \supseteq Z_7, \ Y''_2 \supseteq Z_8, \ Y''_3 \cap Z_7 \neq \emptyset
\]
i.e. \( \alpha \in R(D'_1) \). Of this we have

\[
R(D'_1) \subseteq R(D'_1), \quad R(D'_2) \subseteq R(D'_1), \quad R(D'_1) \subseteq R(D'_2), \quad R(D'_2) \subseteq R(D'_1)
\]

By the equality (5.4) we have

\[
R'(Q_{0}) = R(D'_1) \cup R(D'_2)
\]

(5.5)

Now we show that the following equality is true:

\[
R(D'_1) \cap R(D'_2) = \emptyset
\]

(5.6)

If \( \alpha \in R(D'_1) \cap R(D'_2) \), then

\[
Y''_1 \supseteq Z_7, \ Y''_2 \supseteq Z_8, \ Y''_3 \cup Y''_4 \supseteq Z_4, \ Y''_2 \cap D \neq \emptyset,
\]

\[
Y''_3 \supseteq Z_7, \ Y''_2 \cup Y''_3 \supseteq Z_4, \ Y''_2 \cap D \neq \emptyset
\]

It follows that \( Y''_1 \supseteq Z_7 \cup Z_8 = Z_4 \), \( Y''_2 \supseteq Z_7 \cup Z_8 = Z_4 \) and \( Y''_3 \cap Y''_4 \supseteq Z_8 \cap Z_4 \neq \emptyset \), but the inequality \( Y''_3 \cap Y''_4 \neq \emptyset \) contradiction of the condition that representation of binary relation \( \alpha \) is quasinormal. So, the equality \( R(D'_1) \cap R(D'_2) = \emptyset \) is hold.

Now by the equalities of (5.5) and (5.6) immediately follows that the following equality is true

\[
R'(Q_{0}) = R(D'_1) \cup R(D'_2) \]

The Lemma is proved.

Lemma 5.4. Let \( D = \{Z_1, Z_2, Z_3, Z_4, Z_5, Z_6, Z_7, Z_8, \} \in \Sigma_2(X,8), \quad Z_6 \cap Z_7 = \emptyset, \quad Z_7 \cap Z_8 = \emptyset \) and \( Z_5 \cap Z_8 \neq \emptyset \). If \( X \) be a finite set, then

\[
R'(Q_{0}) = 10 \cdot \left( |Z_6|^{4} - 3 |Z_7|^{4} \right) \cdot 4^{\text{col}}
\]

(see definition 1.4).

Proof: As is well known \( \lambda(Q_{0}, Q_{10}) = 2 \) (see [7]) and \( |Q_{0}| = 5 \), then by lemma 5.3 and by statement 10) of Lemma 1.1 we obtain the validity of Lemma 5.4.

The Lemma is proved.

13) Let binary relation \( \alpha \) of the semigroup \( B_x(D) \) satisfying the condition 13) of the Theorem 5.1. In this case we have that

\[
Q_{13} = \{ \{Z_1, Z_2, Z_3, Z_4, Z_5, Z_6, Z_7, Z_8, \} \}
\]

If the equality \( D'_1 = \{Z_1, Z_2, Z_3, Z_4, Z_5, Z_6, Z_7, Z_8, \} \), \( D'_2 = \{Z_1, Z_2, Z_3, Z_4, Z_5, Z_6, Z_7, Z_8, \} \), is fulfilled, then

\[
R'(Q_{13}) = R(D'_1) \cup R(D'_2)
\]

(5.7)

(see definition 1.4).

Lemma 5.5 Let \( D = \{Z_1, Z_2, Z_3, Z_4, Z_5, Z_6, Z_7, Z_8, \} \in \Sigma_2(X,8), \quad Z_6 \cap Z_7 = \emptyset, \quad Z_7 \cap Z_8 = \emptyset \) and \( Z_5 \cap Z_8 \neq \emptyset \). If \( X \) be a finite set and by \( R'(Q_{0}) \) denoted all regular elements of the semigroup \( B_x(D) \) satisfying the condition 13) of the Theorem 5.1, then

\[
R'(Q_{0}) = |R(D'_1)| + |R(D'_2)|
\]

Proof. We show that the following equality is true:
If \( \alpha \in R(D'_1) \cap R(D'_2) \), then
\[
Y^\alpha_1 = Z_1, Y^\alpha_1 = Z_4, Y^\alpha_2 \cup Y^\alpha_3 \supseteq Z_3, Y^\alpha_2 \cap Z_3 \neq \emptyset, \\
Y^\alpha_3 \supseteq Z_3, Y^\alpha_3 \supseteq Z_4, \\
Y^\alpha_1 \cap Y^\alpha_2 \subseteq Z_1, Y^\alpha_1 \cap Z_1 \neq \emptyset.
\]

It follows that \( Y^\alpha_1 \supseteq Z_1 \cup Z_3 = Z_4 \), \( Y^\alpha_2 \supseteq Z_3 \cup Z_4 = Z_4 \) and \( Y^\alpha_2 \cap Y^\alpha_3 \supseteq Z_4 \), but the inequality \( Y^\alpha_1 \cap Y^\alpha_3 \neq \emptyset \) contradicts the condition that the representation of binary relation \( \alpha \) is quazinormal.

So, the equality \( R(D'_1) \cap R(D'_2) = \emptyset \) is hold.

Now by the equalities of (5.7) and (5.8) immediately follows that the following equality is true
\[
|Q'(\alpha)| = |R(D'_1)| + |R(D'_2)|
\]

The Lemma is proved.

**Lemma 5.6.** Let \( D = \{Z_1, Z_2, Z_3, Z_4, Z_5, Z_6, Z_7, Z_8\} \in D_1(X, 8) \), \( Z_6 \cap Z_8 = \emptyset \), \( Z_7 \cap Z_8 = \emptyset \) and \( Z_6 \cap Z_8 \neq \emptyset \). If \( X \) is a finite set, then
\[
|Q'(\alpha)| = 2 \cdot (2^{[8]} - 1) \cdot 2^{[8]} + 2 \cdot (2^{[8]} - 1) \cdot 2^{[8]}
\]

**Proof:** As is well known \( |\Phi(Q_1, Q_2)| = 1 \) (see [7]) and \( |Q(Q_1)| = 2 \), then by Lemma 5.7 and by statement 14) of Lemma 1.1 we obtain the validity of Lemma 5.6.

The Lemma is proved.

14) Let binary relation \( \alpha \) of the semigroup \( B_x(D) \) satisfying the condition 14) of the Theorem 5.1. In this case we have that
\[
Q_{14} = \{Z_7, Z_6, Z_4, Z_5, Z_3, Z_2, D\}
\]

If the equality \( D'_1 = \{Z_1, Z_6, Z_5, Z_4, Z_3, D\}, D'_2 = \{Z_7, Z_6, Z_5, Z_4, Z_2, D\} \) is fulfilled, then
\[
R'(Q_{14}) = R(D'_1) \cup R(D'_2)
\]

(see definition 1.4).

**Lemma 5.7.** Let \( D = \{Z_1, Z_2, Z_3, Z_4, Z_5, Z_6, Z_7, Z_8\} \in D_1(X, 8) \), \( Z_6 \cap Z_8 = \emptyset \), \( Z_7 \cap Z_8 = \emptyset \) and \( Z_6 \cap Z_8 \neq \emptyset \). If \( X \) be a finite set and by \( R'(Q_{14}) \) denoted all regular elements of the semigroup \( B_x(D) \) satisfying the condition 14) of the Theorem 5.1, then
\[
|Q'(\alpha)| = |R(D'_1)| + |R(D'_2)|
\]

**Proof:** We show that the following equality is true:
\[
R(D'_1) \cap R(D'_2) = \emptyset
\]

If \( \alpha \in R(D'_1) \cap R(D'_2) \), then
\[
Y^\alpha_1 \supseteq Z_1, Y^\alpha_1 \supseteq Z_4, Y^\alpha_2 \cup Y^\alpha_3 \supseteq Z_3, Y^\alpha_2 \cap Z_3 \neq \emptyset, \\
Y^\alpha_3 \supseteq Z_3, Y^\alpha_3 \supseteq Z_4, \\
Y^\alpha_1 \cap Y^\alpha_2 \cap Z_1, Y^\alpha_1 \cap Z_1 \neq \emptyset, \\
Y^\alpha_3 \cap Y^\alpha_2 \supseteq Z_1, Y^\alpha_3 \cap Z_1 \neq \emptyset.
\]

It follows that \( Y^\alpha_1 \cup Y^\alpha_3 \supseteq Z_3 \), \( Y^\alpha_1 \cap Y_3 = Z_3 \) and \( Y^\alpha_2 \cap Y^\alpha_3 \supseteq Z_4 \), but the inequality \( Y^\alpha_1 \cap Y^\alpha_2 \neq \emptyset \) contradicts the condition that representation of binary relation \( \alpha \) is quazinormal.

So, the equality \( R(D'_1) \cap R(D'_2) = \emptyset \) is hold.

Now by the equalities of (5.9) and (5.10) immediately follows that the following equality is true
\[
|Q'(\alpha)| = |R(D'_1)| + |R(D'_2)|
\]

The Lemma is proved.

**Lemma 5.8.** Let \( D = \{Z_1, Z_2, Z_3, Z_4, Z_5, Z_6, Z_7, Z_8\} \in D_1(X, 8) \), \( Z_6 \cap Z_8 = \emptyset \), \( Z_7 \cap Z_8 = \emptyset \) and \( Z_6 \cap Z_8 \neq \emptyset \). If \( X \) is a finite set, then
\[
|Q'(\alpha)| = 2 \cdot (2^{[8]} - 1) \cdot 2^{[8]} + 2 \cdot (2^{[8]} - 1) \cdot 2^{[8]}
\]

**Proof:** As is well known \( |\Phi(Q_{14}, Q_{14})| = 1 \) (see [7]) and \( |Q(Q_{14})| = 2 \), then by Lemma 5.7 and by statement 14) of Lemma 1.1 we obtain the validity of Lemma 5.8.

The Lemma is proved.
15) Let binary relation $\alpha$ of the semigroup $B_0(D)$ satisfying the condition 15) of the Theorem 5.1. In this case we have that

$$Q_{15} = \{Z_7, Z_6, Z_4, Z_3, Z_2, Z_1, D\}$$

If the equality $D' = \{Z_7, Z_6, Z_4, Z_3, Z_2, Z_1, D\}$, $D_1 = \{Z_7, Z_6, Z_4, Z_3, Z_2, Z_1, D\}$ is fulfilled, then

$$R^*(Q_{15}) = R(D') \cup R(D_1')$$

(see definition 1.4).

**Lemma 5.9.** Let $D = \{Z_7, Z_6, Z_4, Z_3, Z_2, Z_1, D\} \in \Sigma_1(X, 8)$, $Z_6 \cap Z_3 = \emptyset$, $Z_7 \cap Z_3 = \emptyset$ and $Z_3 \cap Z_3 = \emptyset$. If $X$ be a finite set and by $R^*(Q_{15})$ denoted all regular elements of the semigroup $B_0(D)$ satisfying the condition 15) of the Theorem 5.1, then

$$|R^*(Q_{15})| = |R(D')| + |R(D_1')|$$

**Proof:** We show that the following equality is true:

$$R(D') \cap R(D_1') = \emptyset$$

(5.12)

If $\alpha \in R(D') \cap R(D_1')$, then

$$Y''_a = Z_7, Y''_b = Z_6, Y''_c = Z_4, Y''_d = Z_3, Y''_e = Z_2, Y''_f = Z_1, Y''_g = \emptyset, Y''_h = Z_3 \neq \emptyset, Y''_i = Z_6 \neq \emptyset.$$ 

It follows that $Y''_a = Z_7 \cup Z_6 = Z_4$, $Y''_b = Z_4 \cup Z_3 = Z_4$, $Y''_c = Z_4 \cup Z_2 = Z_4$ and $Y''_d \neq Z_7 \cup Z_3 \neq \emptyset$, but the inequality $Y''_a \cap Y''_b \neq \emptyset$ contradiction of the condition that representation of binary relation $\alpha$ is quazinormal.

So, the equality $R(D') \cap R(D_1') = \emptyset$ is hold.

Now by the equalities of (5.11) and (5.12) immediately follows that the following equality is true

$$|R^*(Q_{15})| = |R(D')| + |R(D_1')|$$

The Lemma is proved.

**Lemma 5.10.** Let $D = \{Z_7, Z_6, Z_4, Z_3, Z_2, Z_1, D\} \in \Sigma_1(X, 8)$, $Z_6 \cap Z_3 = \emptyset$, $Z_7 \cap Z_3 = \emptyset$ and $Z_3 \cap Z_3 = \emptyset$. If $X$ is a finite set, then

$$X = \{1, 2, 3, 4, 5\}, P_0 = \emptyset, P_1 = \{1\}, P_2 = \{2\}, P_3 = \{3\}, P_4 = \{4\}, P_5 = \{5\}, P_6 = \emptyset, P_7 = \emptyset.$$
Then \( D = \{1, 2, 3, 4, 5\}, Z_1 = \{2, 3, 4, 5\}, Z_2 = \{1, 3, 4, 5\}, Z_3 = \{2, 4, 5\}, Z_4 = \{3, 5\}, Z_5 = \{1, 3, 4\}, Z_6 = \{5\}, Z_7 = \{3\}\) and
\[ D = \{\{3\}, [5], [1, 3, 4], [3, 5], [2, 4, 5], [1, 3, 4, 5], [2, 3, 4, 5], [1, 2, 3, 4, 5]\}. \]

Therefore we have that following equality and inequality is valid:
\[ Z_1 \cap Z_6 = \{3\} \cap \{5\} = \emptyset, \]
\[ Z_3 \cap Z_7 = \{3\} \cap \{2, 4, 5\} = \emptyset, \]
\[ Z_5 \cap Z_7 = \{5\} \cap \{1, 3, 4\} = \emptyset, \]
\[ Z_1 \cap Z_5 = \{2, 4, 5\} \cap \{1, 3, 4, 5\} \neq \emptyset, \]
\[ Z_1 \cap Z_7 = \{2, 4, 5\} \cap \{3\} \neq \emptyset. \]

where \( |D(Q)| = 8, |D(Q_2)| = 437, |D(Q_3)| = 1116, |D(Q_4)| = 156, |D(Q_5)| = 350, |D(Q_6)| = 16, |D(Q_7)| = 24, \]
\[ |D(Q_8)| = 4, |D(Q_9)| = 162, |D(Q_{10})| = 370, |D(Q_{11})| = 56, |D(Q_{12})| = 12, \]
\[ |D(Q_{13})| = 60, |D(Q_{14})| = 12, \]
\[ |D(Q_{15})| = 4, |R_1| = 2787. \]

**Theorem 6.1.** Let \( D = \{z_1, z_2, z_3, z_4, z_5, z_6, z_7, d\} \in \Sigma_1(x, s) \) and \( Z_5 \cap Z_7 = \emptyset. \) Then a binary relation \( \alpha \) of the semigroup \( B_7(D) \) that has a quasinormal representation of the form to be given below is a regular element of this semigroup iff there exist a complete \( \alpha \)-isomorphism \( \phi \) of the semilattice \( V(D, \alpha) \) on some subsemilattice \( D' \) of the semilattice \( D \) that satisfies at least one of the Theorem 2.1 and only one following conditions:

9) \( \alpha = (Y_{T'} \times T') \cup (Y_{T} \times T) \cup (Y_{T} \times T \cup T'), \) where \( T, T' \in D, T \cap T' \neq \emptyset, T \cap T \neq \emptyset, \]
\[ Y_{T'} \supseteq \varphi(T), Y_{T} \supseteq \varphi(T'); \]

10) \( \alpha = (Y_{T} \times T') \cup (Y_{T'} \times T) \cup (Y_{T'} \times T \cup T'), \) where \( T, T' \in D, T \cap T' \neq \emptyset, T \cap T \neq \emptyset, \]
\[ Y_{T} \supseteq \varphi(T), Y_{T'} \supseteq \varphi(T'), \]

13) \( \alpha = (Y_{T} \times T') \cup (Y_{T'} \times T) \cup (Y_{T} \times T \cup T'), \) where \( T, T', Z \in D, T \cup T', Z \neq \emptyset, T \cup T' = Z, \]
\[ T \cap T' \neq \emptyset, \]
\[ Y_{T} \supseteq \varphi(T), Y_{T'} \supseteq \varphi(T), \]
\[ Y_{T} \cap \varphi(T') \neq \emptyset, \]

14) \( \alpha = (Y_{T} \times T') \cup (Y_{T'} \times T) \cup (Y_{T} \times Z) \cup (Y_{Z} \times T') \cup (Y_{Z} \times T) \cup (Y_{Z} \times \emptyset), \) where \( T, T', Z \neq \emptyset, \]
\[ Y_{T} \supseteq \varphi(T), Y_{T'} \supseteq \varphi(T), \]
\[ Y_{T} \cap \varphi(T') \neq \emptyset, \]

15) \( \alpha = (Y_{T} \times Z) \cup (Y_{T} \times T) \cup (Y_{T} \times Z) \cup (Y_{T} \times Z) \cup (Y_{T} \times Z) \cup (Y_{T} \times \emptyset), \) where \( T, T', Z \neq \emptyset, \]
\[ Y_{T} \supseteq \varphi(T), Y_{T'} \supseteq \varphi(T), \]
\[ Y_{T} \cap \varphi(T') \neq \emptyset, \]

16) \( \alpha = (Y_{T} \times Z) \cup (Y_{T} \times Z) \cup (Y_{T} \times Z) \cup (Y_{T} \times Z) \cup (Y_{T} \times Z) \cup (Y_{T} \times \emptyset), \) where \( Y_{T} \supseteq \varphi(T), Y_{T'} \supseteq \varphi(T), \]
\[ Y_{T} \cap \varphi(T') \neq \emptyset, \]

13) \( \alpha = (Y_{T} \times T') \cup (Y_{T'} \times T) \cup (Y_{T} \times T \cup T'), \) where \( T, T' \subseteq Z, \]
\[ T \cap T' \neq \emptyset, \]
\[ Y_{T} \supseteq \varphi(T), Y_{T'} \supseteq \varphi(T'), \]
\[ Y_{T} \cap \varphi(T') \neq \emptyset, \]

Proof. In this case, when \( Z_5 \cap Z_7 = \emptyset, \) from the Lemma 2.8 in [7] it follows that diagrams 1-16 given in fig.1 exhibit all diagrams of the semilattices of the semilattices \( D, \) a quasinormal representation of regular elements of the semigroup \( B_7(D), \) which are defined by these \( \alpha_{\theta} \)-semilattices, may have one of the forms listed above. The statements 9), 10) immediately follows from the Theorem 13.2.1 in [1], 13.2.1 in [2], the statements 13), 14) immediately follows from the Theorem 13.4.1 in [1], 13.4.1 in [2], the statement 13) immediately follows from the Theorem 13.10.1 in [1], the statement 16) immediately follows from the Theorem 2.2 in [5].

The Theorem is proved.
9. Let binary relation \( \alpha \) of the semigroup \( B_4(D) \) satisfying the condition 9) of the Theorem 5.1. In this case we have that
\[
Q_0, \delta_{Q_0} = \{\{Z_7, Z_6, Z_4\}, \{Z_7, Z_5, Z_1\}, \{Z_6, Z_5, Z_2\}, \{Z_5, Z_3, D\}\}
\]

If the equalities
\[
D'_1 = \{Z_7, Z_6, Z_4\}, \; D'_2 = \{Z_7, Z_5, Z_1\}, \; D'_3 = \{Z_6, Z_5, Z_2\}, \; D'_4 = \{Z_7, Z_3, D\}, \; D'_5 = \{Z_6, Z_5, Z_2, D\}
\]
are fulfilled, then
\[
R^*(Q_0) = \bigcup_{i=1}^{8} R(D'_i)
\]
(see Definition 1.4).

**Lemma 6.1.** Let \( D = \{Z_7, Z_6, Z_4, Z_5, Z_1, Z_2, Z_3, D\} \in \Sigma_2(X, 8) \) and \( Z_4 \cap Z_3 = \emptyset \). If \( X \) is a finite set and by \( R^*(Q_0) \) denoted all regular elements of the semigroup \( B_4(D) \) satisfying the condition 9) of the Theorem 6.1, then
\[
|R^*(Q_0)| = |R(D'_1)| + |R(D'_2)|
\]

**Proof:** Let \( \alpha \in R(D'_1) \), then quasinormal representation of a binary relation \( \alpha \) has form
\[
\alpha = (Y''_r \times T') \cup (Y''_r \times T) \cup (Y''_r \times (T \cup T'))
\]
for some \( T \cap T' = \emptyset \), \( T', T' \cup T = D \), \( Y''_r, Y''_r \notin \{\emptyset\} \) and by statement 9) of the theorem 5.1 satisfies the conditions \( Y''_r \supseteq Z_7 \), \( Y''_r \supseteq Z_5 \). By definition of the semilattice \( D \) we have \( Z_7 \supseteq Z_7 \) and \( Z_5 \supseteq Z_5 \). Of this we have: \( Y''_r \supseteq Z_7 \), \( Y''_r \supseteq Z_5 \), i.e. \( \alpha \in R(D'_1) \). It follows that \( R(D'_1) \subseteq R(D'_2) \). Of this we have \( R(D'_1) \subseteq R(D'_2) \), \( R(D'_2) \subseteq R(D'_3) \), \( R(D'_3) \subseteq R(D'_4) \), \( R(D'_4) \subseteq R(D'_1) \), \( R(D'_1) \subseteq R(D'_2) \).

Therefore by the equality (6.1) we have
\[
R^*(Q_0) = R(D'_1) \cup R(D'_2)
\]
Now we show that the following equality is true:
\[
R(D'_1) \cap R(D'_2) = \emptyset
\]
If \( \alpha \in R(D'_1) \cap R(D'_2) \), then
\[
Y''_r \supseteq Z_7, \; Y''_r \supseteq Z_5,
\]
\[
Y''_r \supseteq Z_7, \; Y''_r \supseteq Z_5.
\]
It follows that \( Y''_r \supseteq Z_7 \cup Z_5 = Z_4 \), \( Y''_r \supseteq Z_7 \cup Z_5 = Z_4 \) and \( Y''_r \cap Y''_r = Z_7 \cap Z_5 = \emptyset \), but the inequality \( Y''_r \cap Y''_r \neq \emptyset \) contradiction of the condition that representation of binary relation \( \alpha \) is quasinormal.

So, the equality \( R(D'_1) \cap R(D'_2) = \emptyset \) is hold.

Now by the equalities of (6.2) and (6.3) immediately follows that the following equality is true
\[
|R^*(Q_0)| = |R(D'_1)| + |R(D'_2)|
\]
The Lemma is proved.

**Lemma 6.2.** Let \( D = \{Z_7, Z_6, Z_4, Z_5, Z_1, Z_2, Z_3, D\} \in \Sigma_2(X, 8) \) and \( Z_4 \cap Z_3 = \emptyset \). If \( X \) is a finite set, then
\[
|R^*(Q_0)| = 8 \cdot 3^{M-1}
\]

**Proof:** As is well known \( |\Phi(Q_0, Q_0)| = 2 \) (see [7]) and \( |\Omega(Q_0)| = 4 \), then by Lemma 6.1 and by statement 9) of Lemma 1.1 we obtain the validity of Lemma 6.2.

The Lemma is proved.

13) Let binary relation \( \alpha \) of the semigroup \( B_4(D) \) satisfying the condition 13) of the Theorem 6.1. In this case we have that
\[
Q_1, \delta_{Q_1} = \{\{Z_7, Z_6, Z_4, Z_3, Z_1\}, \{Z_7, Z_5, Z_1\}, \{Z_6, Z_5, Z_2\}, \{Z_5, Z_3, D\}, \{Z_6, Z_5, Z_2, D\}\}
\]

If the equality
\[
D'_1 = \{Z_7, Z_6, Z_4, Z_5, Z_1\}, \; D'_2 = \{Z_7, Z_6, Z_3, Z_4\}, \; D'_3 = \{Z_7, Z_5, Z_1, D\}, \; D'_4 = \{Z_6, Z_5, Z_2, D\}
\]
Lemma 6.3. Let \( D = \{Z_7, Z_6, Z_5, Z_4, Z_2, Z_1, D\} \) be a finite set and by \( R^*(Q_{13}) \) denoted all regular elements of the semigroup \( B_{X(D)} \) satisfying the condition 13) of the Theorem 6.1, then

\[
R^*(Q_{13}) = R(D'_1) \cup R(D'_2) \cup R(D'_3) \cup R(D'_4)
\]

(6.4)

(see definition 1.4).

**Proof:** Let \( \alpha \in R(D'_1) \), then quasinormal representation of a binary relation \( \alpha \) has form

\[
\alpha = (Y_\alpha \times T) \cup (Y_\alpha \times T') \cup (Y_\alpha \times (T \cup T')) \cup (Y_\alpha \times T') \cup (Y_\alpha \times Z_2)
\]

for some \( T \times T' \neq \emptyset \), \( T \times T' \neq \emptyset \), \( T \times (T \cup T') \neq \emptyset \), \( T' \times (T \cup T') \neq \emptyset \), \( Y_\alpha, Y'_\alpha, Y''_\alpha, \emptyset \}, \) and by statement 13) of the theorem 6.1 satisfies the conditions \( Y_\alpha \supseteq Z_7 \), \( Y'_\alpha \supseteq Z_6 \), \( Y''_\alpha \supseteq Z_5 \), \( Y''_\alpha \cap Z_6 \neq \emptyset \). By definition of the semilattice \( D \) we have \( Z_5 \supseteq Z_k \) and \( Z_7 \supseteq Z_7 \). Of this we have: \( Y'_\alpha \supseteq Z_7 \), \( Y'_\alpha \supseteq Z_6 \), \( Y''_\alpha \supseteq Z_5 \), \( Y''_\alpha \cap Z_6 \neq \emptyset \), i.e. \( \alpha \in R(D'_1) \). It follows that \( R(D'_1) \subseteq R(D'_1) \). Of this we have \( R(D'_1) \subseteq R(D'_1) \).

Therefore by the equality (6.4) we have

\[
R^*(Q_{13}) = R(D'_1) \cup R(D'_2)
\]

(6.5)

Now we show that the following equality is true:

\[
R(D'_1) \cap R(D'_2) = \emptyset
\]

(6.6)

If \( \alpha \in R(D'_1) \cap R(D'_2) \), then

\[
Y'_\alpha \supseteq Z_7, \ Y'_\alpha \supseteq Z_6, \ Y'_\alpha \cup Y''_\alpha \supseteq Z_5, \ Y''_\alpha \cap Z_6 \neq \emptyset
\]

\[
Y'_\alpha \supseteq Z_6, \ Y'_\alpha \supseteq Z_7, \ Y'_\alpha \cup Y''_\alpha \supseteq Z_5, \ Y''_\alpha \cap Z_6 \neq \emptyset
\]

It follows that \( Y'_\alpha \supseteq Z_7 \cup Z_6 = Z_4 \), \( Y'_\alpha \supseteq Z_6 \cup Z_7 = Z_4 \) and \( Y'_\alpha \cap Z_6 \neq \emptyset \), but the inequality \( Y''_\alpha \cap Z_6 \neq \emptyset \) contradicts the condition that representation of binary relation \( \alpha \) is quasinormal.

So, the equality \( R(D'_1) \cap R(D'_2) = \emptyset \) is hold.

Now by the equalities of (6.5) and (6.6) immediately follows that the following equality is true

\[
\left| R^*(Q_{13}) \right| = \left| R(D'_1) \right| + \left| R(D'_2) \right|
\]

The Lemma is proved.

**Lemma 6.4.** Let \( D = \{Z_7, Z_6, Z_5, Z_4, Z_2, Z_1, D\} \) be a finite set and \( Z_5 \cap Z_3 = \emptyset \). If \( X \) is a finite set, then

\[
\left| R^*(Q_{13}) \right| = 4 \cdot \left( 2^{[D]} - 1 \right) \cdot 8^{[D]} + 4 \cdot \left( 2^{[D]} - 1 \right) \cdot 8^{[D]}
\]

(6.7)

**Proof:** As is well known \( \Phi(Q_{13}, Q_{13}) = 1 \) (see [7]) and \( \Omega(Q_{13}) = 4 \), then by Lemma 6.3 and by statement 13) of Lemma 1.1 we obtain the validity of Lemma 6.4.

The Lemma is proved.

**Lemma 16.** Let binary relation \( \alpha \) of the semigroup \( B_{X(D)} \) satisfying the condition 16) of the Theorem 6.1. In this case we have that

\[
Q_{16} = \{(Z_7, Z_6, Z_5, Z_4, Z_2, Z_1, D)\}
\]

If the equality \( D'_1 = \{Z_7, Z_6, Z_5, Z_4, Z_2, Z_1, D\} \) is fulfilled, then \( R^*(Q_{16}) = R(D'_1) \) (see definition 1.4) and

\[
\left| R^*(Q_{16}) \right| = \left| R(D'_1) \right|
\]

(6.8)

**Lemma 6.5.** Let \( D = \{Z_7, Z_6, Z_5, Z_4, Z_2, Z_1, D\} \) be a finite set and \( Z_5 \cap Z_3 = \emptyset \). If \( X \) is a finite set, then

\[
\left| R^*(Q_{16}) \right| = 2 \cdot \left( 2^{[D]} - 1 \right) \cdot \left( 2^{[D]} - 1 \right) \cdot 8^{[D]}
\]

**Proof:** As is well known \( \Phi(Q_{16}, Q_{16}) = 2 \) (see [7]) and \( \Omega(Q_{16}) = 1 \), then by equality (6.7) and by statement 16) of Lemma 1.1 we obtain the validity of Lemma 6.5.

The Lemma is proved.
Let $X$ be a finite set and assume that
\[
r_{i} = |R' (Q_{0})| + |R' (Q_{1})| + |R' (Q_{2})| + |R' (Q_{3})| + |R' (Q_{4})| + |R' (Q_{5})| =
\]
\[
= 8 \cdot 3^{k_{X} d_{4}} + 10 \cdot (4^{k_{X} d_{4}} - 3^{k_{X} d_{4}}) \cdot 3^{k_{X} d_{4}} + 4 \cdot (4^{k_{X} d_{4}} - 3^{k_{X} d_{4}}) \cdot (5^{k_{X} d_{4}} - 4^{k_{X} d_{4}}) \cdot 5^{k_{X} d_{4}} +
\]
\[
+ 4 \cdot (4^{k_{X} d_{4}} - 3^{k_{X} d_{4}}) \cdot (5^{k_{X} d_{4}} - 4^{k_{X} d_{4}}) \cdot (6^{k_{X} d_{4}} - 5^{k_{X} d_{4}}) \cdot 6^{k_{X} d_{4}} + 2 \cdot (2^{k_{X} d_{4}} - 1) \cdot 7^{k_{X} d_{4}} +
\]
\[
+ 2 \cdot (2^{k_{X} d_{4}} - 1) \cdot (3^{k_{X} d_{4}} - 2^{k_{X} d_{4}}) \cdot 8^{k_{X} d_{4}} = \]
\[
(|R' (Q_{0})|, |R' (Q_{1})|, |R' (Q_{2})|, |R' (Q_{3})| \text{ and } |R' (Q_{4})| \text{ see in the Lemma 5.4, Lemma 2.6, Lemma 2.7, Lemma 5.7 and 5.10 respectively}).
\]

**Theorem 6.2.** Let $D = \{Z_{1}, Z_{2}, Z_{3}, Z_{4}, Z_{5}, Z_{6}, Z_{7}, \ldots, \bar{D} \} \in \Sigma_{6} (X, 8)$ and $Z_{1} \cap Z_{7} = \emptyset$. If $X$ is a finite set and $R_{o}$ is a set of all regular elements of the semigroup $B_{x} (D)$, then $|R_{o}| = r_{i} + r_{g}$.

**Proof:** This Theorem immediately follows from the Theorem 6.1.

The Theorem is proved.

**Example 5.6.1.** Let $X = \{1, 2, 3, 4\}$,

\[
R = \{ \emptyset \}, P_{1} = \{1\}, P_{2} = \{2\}, P_{3} = \{3\}, P_{4} = \{4\}, P_{5} = \{ \emptyset \}, P_{6} = \{ \emptyset \}.
\]

Then $D = \{1, 2, 3, 4\}, Z_{1} = \{2, 3, 4\}, Z_{2} = \{1, 3, 4\}, Z_{3} = \{2, 4\}, Z_{4} = \{3, 4\}, Z_{5} = \{1, 3\}, Z_{6} = \{4\}, Z_{7} = \{3\}$ and $D = \{\emptyset, \{1\}, \{2\}, \{3\}, \{4\}, \{1, 2\}, \{1, 3\}, \{1, 4\}, \{2, 3\}, \{2, 4\}, \{3, 4\}, \{1, 2, 3\}, \{1, 2, 4\}, \{1, 3, 4\}, \{2, 3, 4\}, \{1, 2, 3, 4\}\}.$

Therefore we have that following equality and inequality is valid:

\[
Z_{5} \cap Z_{7} = \emptyset, \quad \text{valid:}
\]

\[
|R' (Q_{0})| = 8, \quad |R' (Q_{1})| = 209, \quad |R' (Q_{2})| = 324, \quad |R' (Q_{3})| = 36, \quad |R' (Q_{4})| = 126, \quad |R' (Q_{5})| = 8, \quad |R' (Q_{6})| = 4, \quad |R' (Q_{7})| = 2, \quad |R_{o}| = 927.
\]
