Keywords: $g\omega\alpha$-closed, $g\omega\alpha$-continuous, $g\omega\alpha$-irresolute, locally closed, $g\omega\alpha$-locally closed.  

Abstract. In the year 2014, the present authors introduced and studied the concept of $g\omega\alpha$-closed sets in topological spaces. The purpose of this paper is to introduce a new class of locally closed sets called $g\omega\alpha$-locally closed sets (briefly $g\omega\alpha$-lc sets) and study some of their properties. Also $g\omega\alpha$-locally closed continuous (briefly $g\omega\alpha$-continuous) functions and its irresolute functions are introduced and studied their properties in topological spaces.  

1. Introduction  
The notion of locally closed sets was introduced by Bourbaki [6]. According to him, a subset of a topological space $X$ is locally closed in $X$ if it is the intersection of an open set and closed set in $X$. Kuratowski and Sierpinski [10] considered the difference of two closed subsets of an $n$-dimensional euclidean space. Implicit in their work is the notion of a locally closed subset of a topological space $X$. Stone [17] has used the term FG for a locally closed subset as the spaces that in every embedding are locally closed. The results of Borges [5] show that locally closed sets play an important role in the context of simple extension. Ganster and Reilly [8] has introduced locally closed sets, which are weaker forms of both open and closed sets and they used locally closed sets to define LC-continuity and LC-irresoluteness. Sundaram [18] introduced the concept of generalized locally closed sets. After that Balachandran et al. [3], Gnanambal [9], Arokhiarani et al. [1], Pushpalatha [14], Shaik John [15] and P.G. Patil [13] have introduced $\alpha$-locally closed, generalized locally semi closed, semi generalized locally closed, regular generalized locally closed, strongly locally closed, $\omega$-locally closed and $g\omega\alpha$-locally closed sets and their continuous maps in topological spaces respectively. Also various authors have contributed to the development of generalizations of locally closed sets and locally continuous maps in topological spaces.  

In this paper, we introduced the notion of $g\omega\alpha$-locally closed sets which are denoted by $g\omega\alpha – LC$ sets and study some of the fundamental properties of $g\omega\alpha – LC$ sets in generalized topological spaces.  

2. Preliminary  
Throughout this paper $(X, \tau)$ or simply $X$ represents topological space on which no separation axioms are assumed unless and otherwise mentioned. For a subset $A$ of $X$, $\text{cl}(A)$, $\text{int}(A)$ and $A^c$ denote the closure of $A$, interior of $A$ and complement of $A$ respectively. If $A$ is a subset of a space $\tau$, then $C_\tau(A)$ is the smallest $\tau$-closed set containing $A$ and $I_\tau(A)$ is the largest $\tau$-open set contained in $A$.  

For our analysis, we require the following basic definitions.  

Definition 2.1. A subset $A$ of a topological space $(X, \tau)$ is called  
(i) $\alpha$-open set [12] if $A \subseteq \text{int}(\text{cl}(\text{int}(A)))$.  
(iii) Regular open set [16] if $A = \text{int}(\text{cl}(A))$.  

SciPress applies the CC-BY 4.0 license to works we publish: https://creativecommons.org/licenses/by/4.0/
The complements of the above mentioned sets are called their respective closed sets.

**Definition 2.2.** [4] A subset $A$ of $X$ is $\omega\alpha$-closed if $\alpha \text{cl}(A) \subseteq U$ whenever $A \subseteq U$ and $U$ is $\omega\alpha$-open in $X$.

The family of all $\omega\alpha$-closed subsets of the space $X$ is denoted by $G\omega\alpha C(X)$.

**Definition 2.3.** [4] The intersection of all $\omega\alpha$-closed sets containing a set $A$ is called $\omega\alpha$-closure of $A$ and is denoted by $\omega\alpha$-cl($A$).

A set $A$ is $\omega\alpha$-closed if and only if $\omega\alpha$-cl($A$) = $A$.

**Definition 2.4.** [4] The union of all $\omega\alpha$-open sets contained in $A$ is called $\omega\alpha$-interior of $A$ and is denoted by $\omega\alpha$-int($A$).

A set $A$ is $\omega\alpha$-open if and only if $\omega\alpha$-int($A$) = $A$.

**Definition 2.5.** A topological space $X$ is said to be
1. locally closed [8] if $A = U \cap V$ where $U$ is open set and $V$ is closed set in $X$.
2. generalized locally closed (briefly glc-closed) [2] if $A = U \cap V$ where $U$ is $g$-open set and $V$ is $g$-closed set in $X$.
3. generalized locally semi-closed (briefly gslc-closed) [9] if $A = U \cap V$ where $U$ is $g$-open set and $V$ is semi-closed set in $X$.
4. strongly generalized locally closed (briefly lcg-closed) [14] if $A = U \cap V$ where $U$ is strongly $g$-open set and $V$ is strongly $g$-closed set in $X$.
5. $\alpha$-locally closed (briefly alc-closed) [9] if $A = U \cap V$ where $U$ is $\alpha$-open set and $V$ is $\alpha$-closed set in $X$.
6. $\omega$-locally closed (briefly olec-closed) [15] if $A = U \cap V$ where $U$ is $\omega$-open set and $V$ is $\omega$-closed set in $X$.
7. $\omega\alpha$-locally closed (briefly $\omega\alpha$lc-closed) [13] if $A = U \cap V$ where $U$ is $\omega\alpha$-open set and $V$ is $\omega\alpha$-closed set in $X$.

**Definition 2.6.** A topological space $X$ is said to be a
1. sub maximal space [7] if every dense subset of $X$ is open in $X$.
2. door space [2] if every subset of $X$ is either open or closed in $X$.

**Definition 2.7.** A function $f$: $X \rightarrow Y$ is called
1. LC-continuous [8] if $f^{-1}(G)$ is locally closed set in $X$ for each open set $G$ of $Y$.
2. LC-irresolute [8] if $f^{-1}(G)$ is locally closed set in $X$ for locally closed set $G$ of $Y$.

3. Locally $\omega\alpha$-Closed Set

In this section, we introduce $\omega\alpha$alc-sets and study some of their properties.

**Definition 3.1.** Let $A$ be a subset of $X$. Then $A$ is called locally $\omega\alpha$-closed if there exists an open set $U$ and $\omega\alpha$-closed set $F$ of $X$ such that $A = U \cap F$.

The collection of all locally $\omega\alpha$-closed sets is denoted by $LG\omega\alpha C(X)$.

**Definition 3.2.** A space is said to have the $\omega\alpha$-closure preserving property if $\omega\alpha$-cl($A$) is always $\omega\alpha$-closed.

**Theorem 3.1.** Suppose $X$ has the $\omega\alpha$-closure preserving property and let $A$ be a subset of $X$. Then $A \in LG\omega\alpha C(X)$ if and only if $A = U \cap \omega\alpha$-cl($A$) for some open set $U$.

**Proof.** Let $A = LG\omega\alpha C(X)$. Then $A = U \cap F$ where $U$ is an open and $F$ is $\omega\alpha$-closed. By definition 3.2, $\omega\alpha$-cl($A$) is $\omega\alpha$-closed in $X$, $A \subseteq F$ implies $\omega\alpha$-cl($A$) $\subseteq F$. Now,
Let \( A = A \cap g_\omega \alpha - cl(A) = U \cap F \cap g_\omega \alpha - cl(A) = U \cap g_\omega \alpha - cl(A) \). Therefore, \( A = U \cap g_\omega \alpha - cl(A) \) for some open set \( U \).

Conversely. Assume that \( A = U \cap g_\omega \alpha - cl(A) \) for some open set \( U \). By definition 3.2, \( g_\omega \alpha - cl(A) \) is \( g_\omega \alpha \)-closed in \( X \). Therefore, \( A \in Lg_\omega \alpha C(X) \). This proves the theorem.

**Definition 3.3.** Let \( A \) be a subset of \( X \). Then \( A \) is called \( g_\omega \alpha \)-locally closed if there exists \( g_\omega \alpha \)-open set \( U \) and a \( g_\omega \alpha \)-closed set \( F \) of \( X \) such that \( A = U \cap F \).

The collection of all \( g_\omega \alpha \)-locally closed sets of \( X \) will be denoted by \( G_\omega \alpha LC(X) \).

**Theorem 3.2.** For a submaximal space \( X \), \( LG_\omega \alpha C(X) \subseteq GLC(X) \).

**Proof.** Let \( A = LG_\omega \alpha C(X) \). Then there exist an open set \( U \) and a \( g_\omega \alpha \)-closed set \( F \) of \( X \) such that \( A = U \cap F \) . In a submaximal space \( X \), every \( g_\omega \alpha \)-closed set is \( g_\omega \alpha \)-closed. Therefore \( F \) is \( g_\omega \alpha \)-closed. Since every open set is \( g_\omega \alpha \)-open, it follows that \( A \) is an intersection of \( g_\omega \alpha \)-open set \( U \) and a \( g_\omega \alpha \)-closed set \( F \) of \( X \). Therefore, \( A \in GLC(X) \). This proves the theorem.

**Theorem 3.3.** Every locally closed set is \( g_\omega \alpha \)-locally closed set but not conversely.

**Proof.** From [4] every closed set is \( g_\omega \alpha \)-closed. Hence the proof follows.

**Example 3.1.** Let \( X = \{a,b,c\} \) and \( \tau = \{X,\phi,\{a,b\}\} \). Then \( GLC(X) = P(X) \) and \( LC(X) = \{X,\phi,\{c\},\{a,b\}\} \). Then the set \( A = \{a,c\} \) is \( g_\omega \alpha \)-locally closed set but not locally closed set in \( X \).

**Remark 3.1.** If \( A \) is \( \alpha \)-locally closed set in \( X \), then \( A \) is \( g_\omega \alpha \)-locally closed in \( X \) but not conversely.

**Example 3.2.** In example 3.1 \( aLC(X) = \{X,\phi,\{c\},\{a,b\}\} \). Then the set \( A = \{a,c\} \) is \( g_\omega \alpha \)-closed but not \( g_\alpha \)-closed in \( X \).

**Theorem 3.4.** For a subset \( A \) of \( X \) the followings are equivalent.
1. \( A \) is \( g_\omega \alpha \)-locally closed.
2. \( A = U \cup c_\alpha (A) \), for some \( g_\omega \alpha \)-open set \( U \).

**Proof.** (i) \( \Rightarrow \) (ii) Let \( A \in g_\omega \alpha cl(X) \) then there exists a \( g_\omega \alpha \)-open set \( U \) and a \( g_\omega \alpha \)-closed set \( V \) such that \( A = U \cap V \). Since \( A \subseteq U \) and \( A \subseteq c_\alpha (A) \), we have \( A \subseteq U \cap c_\alpha (A) \).

Conversely. Since \( c_\alpha (A) \subseteq V, U \cap c_\alpha (A) \subseteq U \cap V = A \), which implies that \( A = U \cap c_\alpha (A) \).

(ii) \( \Rightarrow \) (i) Since \( U \) is \( g_\omega \alpha \)-open and \( c_\alpha (A) \) is \( g_\omega \alpha \)-closed, \( U \cap c_\alpha (A) \in g_\omega \alpha cl(X) \).

**Theorem 3.5.** Suppose a space \( X \) has the \( g_\omega \alpha \)-closure preserving property. Then the followings are equivalent.
1. \( A \in G_\omega \alpha LC(X) \).
2. \( A = U \cap g_\omega \alpha - cl(A) \) for some \( g_\omega \alpha \)-open set \( U \).

**Proof.** (i) \( \Rightarrow \) (ii) Let \( A \in G_\omega \alpha LC(X) \). Then there exist a \( g_\omega \alpha \)-open subset \( U \) and a \( g_\omega \alpha \)-closed subset \( F \) such that \( A = U \cap F \). Since \( A \subseteq U \) and \( A \subseteq g_\omega \alpha - cl(A) \). By definition 3.2, \( g_\omega \alpha - cl(A) \) is \( g_\omega \alpha \)-closed, \( g_\omega \alpha - cl(A) \subseteq F \) and hence \( U \cap g_\omega \alpha - cl(A) \subseteq U \cap F = A \). Therefore, \( A = U \cap g_\omega \alpha - cl(A) \). Thus proves (ii).

(ii) \( \Rightarrow \) (i) By definition 3.2, \( g_\omega \alpha - cl(A) \) is \( g_\omega \alpha \)-closed. Therefore. \( A = U \cap g_\omega \alpha - cl(A) \in G_\omega \alpha LC(X) \).
Definition 3.4. Let \( A \) be a subset of \( X \). Then \( A \) is called *\( \omega \alpha g \)-locally closed if there exist \( \omega \alpha g \)-open set \( U \) and an \( \alpha \)-closed set \( F \) of \( X \) such that \( A = U \cap F \).

The collection of all \( \omega \alpha g \)-locally closed sets of \( X \) will be denoted by \( \text{Go}_\omega \text{aLC}^*(X) \).

Definition 3.5. Let \( A \) be a subset of \( X \). Then \( A \) is called *\( \omega \alpha \text{lcg} \)-set if there exist an \( \alpha \)-open set \( U \) and a \( \omega \alpha g \)-closed set \( F \) of \( X \) such that \( A = U \cap F \).

The collection of all \( \omega \alpha \text{lcg} \)-sets of \( X \) will be denoted by \( \text{Go}_\omega \text{aLC}^{**}(X) \).

Proposition 3.1. For a topological space \( X \) the following inclusions hold:
1. \( aLC(X) \subseteq \text{Go}_\omega \text{aLC}(X) \).
2. \( aLC(X) \subseteq \text{Go}_\omega \text{aLC}^{**}(X) \subseteq \text{Go}_\omega \text{aLC}(X) \).
3. \( aLC(X) \subseteq \text{Go}_\omega \text{aLC}^*(X) \subseteq \text{Go}_\omega \text{aLC}(X) \).

Proof. It follows from the fact that every \( \alpha \)-closed set is \( \omega \alpha g \)-closed in \( X \).

Remark 3.2. We have the following diagram.

![Diagram](image-url)

The reverse implications are not true shown in the following example.

Example 3.3. Let \( X = \{a, b, c\} \) and \( \tau = \{X, \phi, \{a, b\}\} \). Then we have:
\[
\begin{align*}
aLC(X) &= \{X, \phi, \{c\}, \{a, b\}\} \\
\text{Go}_\omega \text{aLC}(X) &= P(X) \\
\text{Go}_\omega \text{aLC}^*(X) &= \{X, \phi, \{a\}, \{b\}, \{c\}, \{a, b\}\} \\
\text{Go}_\omega \text{aLC}^{**}(X) &= \{X, \phi, \{c\}, \{a, b\}, \{b, c\}, \{a, c\}\} \\
\end{align*}
\]

(1) The reverse implication need not be true as seen from the above sets.
(2) It can be also seen that \( \text{Go}_\omega \text{aLC}^*(X) \) and \( \text{Go}_\omega \text{aLC}^{**}(X) \) are independent.

Definition 3.6. A topological space \( X \) is said to be a \( \omega \alpha \)-door space if each subset of \( X \) is either \( \omega \alpha g \)-open or \( \omega \alpha g \)-closed in \( X \).

Example 3.4. Let \( X = \{a, b, c\} \) and \( \tau = \{X, \phi, \{a\}, \{b, c\}\} \). Then \( X \) is \( \omega \alpha \)-door space.

Remark 3.3. If \( X \) is \( \omega \alpha \)-door space

Proposition 3.2. Let \( X \) be a \( T_{\text{goa}} \)-space. Then \( aLC(X) = \text{Go}_\omega \text{aLC}(X) \).

Proof. Since \( X \) is \( T_{\text{goa}} \)-space, every \( \omega \alpha g \)-open set is \( \alpha \)-open and every \( \omega \alpha g \)-closed set is \( \alpha \)-closed. Hence we have \( \text{Go}_\omega \text{aLC}(X) \subseteq aLC(X) \). By proposition 3.1(i), \( aLC(X) \subseteq \text{Go}_\omega \text{aLC}(X) \). Hence \( \text{Go}_\omega \text{aLC}(X) = aLC(X) \).

Proposition 3.3. For a subset \( A \) of a space \( X \) the following statements are equivalent:
1. \( A \in \text{Go}_\omega \text{aLC}(X) \).
2. \( A = U \cap \text{goa} - cl(A) \) for some \( \omega \alpha g \)-open set \( U \) in \( X \).
Proof. (i) ⇒ (ii) Let \( A \in \text{GoaLC}(X) \). Then there exist a \( g_\omega \alpha \) -open set \( U \) and a \( g_\omega \alpha \) -closed set \( F \) of \( X \) such that \( A = U \cap F \). Since \( A \subseteq U \) and \( A \subseteq g_\omega \alpha -cl(A) \), \( A \subseteq U \cap g_\omega \alpha -cl(A) \). Conversely, By definition of \( g_\omega \alpha \) -closure, \( g_\omega \alpha -cl(A) \subseteq F \) and hence \( U \cap g_\omega \alpha -cl(A) \subseteq U \cap F = A \). Therefore \( A = U \cap g_\omega \alpha -cl(A) \).

(ii) ⇒ (i) Assume \( A = U \cap g_\omega \alpha -cl(A) \) for some \( g_\omega \alpha \) -open set \( U \). Since \( g_\omega \alpha -cl(A) \) is \( g_\omega \alpha \) -closed, \( A = U \cap g_\omega \alpha -cl(A) \in \text{GoaLC}(X) \).

**Theorem 3.6.** Let \( X \) be a \( T_{g_\omega \alpha} \)-space. For a subset \( A \) of \( X \) the following statements are equivalent.

1. \( A \in \text{GoaLC}(X) \).
2. \( A = U \cap g_\omega \alpha -cl(A) \) for some \( g_\omega \alpha \) -open set \( U \) in \( X \).
3. \( (g_\omega \alpha -cl(A)) - A \) is \( g_\omega \alpha \) -closed.
4. \( A \cup (X - g_\omega \alpha -cl(A)) \) is \( g_\omega \alpha \) -open.

Proof. (i) ⇔ (ii) Follows from the proposition 3.2.

(ii) ⇒ (iii) Let \( A = U \cap g_\omega \alpha -cl(A) \) for some \( g_\omega \alpha \) -open set \( U \) in \( X \).

Now, \( g_\omega \alpha -cl(A) - A = g_\omega \alpha -cl(A) \cap A^c \)
\[
= g_\omega \alpha -cl(A) \cap (U \cap g_\omega \alpha -cl(A))^c
\]
\[
= g_\omega \alpha -cl(A) \cap [U^c \cup (g_\omega \alpha -cl(A))^c]
\]
\[
=[g_\omega \alpha -cl(A) \cap U^c] \cup [g_\omega \alpha -cl(A) \cap (g_\omega \alpha -cl(A))^c]
\]
\[
=(g_\omega \alpha -cl(A) \cap U^c).
\]

Here \( U^c \) is \( g_\omega \alpha \) -closed. Since \( X \) is \( T_{g_\omega \alpha} \)-space, \( U^c \) is \( \alpha \) -closed. From [4], the intersection of a \( g_\omega \alpha \) -closed set and an \( \alpha \) -closed set is \( g_\omega \alpha \) -closed, \( g_\omega \alpha -cl(A) - A \) is \( g_\omega \alpha \) -closed.

(iii) ⇒ (iv) Let \( U = X - (g_\omega \alpha -cl(A) - A) \). By (iii), \( U \) is a \( g_\omega \alpha \) -open set in \( X \) and \( A = U \cap g_\omega \alpha -cl(A) \) holds.

(iv) ⇒ (iii) Let \( F = g_\omega \alpha -cl(A) - A \). Then \( X - F = A \cup (X - g_\omega \alpha -cl(A)) \) holds. Also, \( X - F \) is \( g_\omega \alpha \) -open, since \( F \) is \( g_\omega \alpha \) -closed by (iii). Hence \( A \cup (X - g_\omega \alpha -cl(A)) \) is \( g_\omega \alpha \) -open.

**Theorem 3.7.** For a subset \( A \) of \( X \) the following statements are equivalent:

1. \( A \in \text{GoaLC}^*(X) \).
2. \( A = U \cap acl(A) \) for some \( g_\omega \alpha \) -open set \( U \) in \( X \).
3. \( acl(A) - A \) is \( g_\omega \alpha \) -closed.
4. \( A \cup (X - acl(A)) \) is \( g_\omega \alpha \) -open.

Proof. Using the fact every \( \alpha \) -closed set is \( g_\omega \alpha \) -closed and from theorem 3.6, the proof follows.

**Theorem 3.8.** For a subset \( A \) of \( X \), \( A \in \text{GoaLC}^{**}(X) \), if and only if \( A = U \cap g_\omega \alpha -cl(A) \) for some \( \alpha \) -open set \( U \) in \( X \).

Proof. Necessity. Let \( A \in \text{GoaLC}^{**}(X) \). Then by definition \( A = U \cap F \) where \( U \) is an \( \alpha \) -open set and \( F \) is a \( g_\omega \alpha \) -closed set containing \( A \). Since \( F \) is a \( g_\omega \alpha \) -closed set, we have \( g_\omega \alpha -cl(A) \subseteq F \), which implies that \( U \cap g_\omega \alpha -cl(A) \subseteq U \cap F = A \). Since \( A \subseteq U \) and \( A \subseteq g_\omega \alpha -cl(A) \) we have \( A \subseteq U \cap g_\omega \alpha -cl(A) \). Therefore \( A = U \cap g_\omega \alpha -cl(A) \), where \( U \) is an \( \alpha \) -open.

Sufficient. Assume that \( A = U \cap g_\omega \alpha -cl(A) \) for some \( \alpha \) -open set \( U \) in \( X \). Since \( g_\omega \alpha -cl(A) \) is \( g_\omega \alpha \) -closed, we have \( A \in \text{GoaLC}^{**}(X) \).
**Definition 3.7.** A subset $A$ of $X$ is called $\omega\alpha$-dense if $g_{\omega\alpha} - \text{cl}(A) = X$.

**Example 3.5.** Let $X = \{a, b, c\}$ and $\tau = \{X, \phi, \{a\}\}$. The only $g_{\omega\alpha}$-closed set containing $\{a\}$ is $X$ and hence $g_{\omega\alpha} - \text{cl}(\{a\}) = X$. Then the subset $\{a\}$ is $g_{\omega\alpha}$-dense in $X$.

**Proposition 3.4.** In a topological space $X$, every $g_{\omega\alpha}$-dense set is $\alpha$-dense but not conversely.

**Proof.** Let $A$ be $g_{\omega\alpha}$-dense set in $X$. Then $g_{\omega\alpha} - \text{cl}(A) = X$. Since $g_{\omega\alpha} - \text{cl}(A) \subseteq \alpha\text{cl}(A)$, we have $\alpha\text{cl}(A) = X$. Hence $A$ is $\alpha$-dense.

**Example 3.6.** Let $X = \{a, b, c\}$ and $\tau = \{X, \phi, \{a\}, \{b, c\}\}$. Then the subset $\{a, b\}$ is $\alpha$-dense in $X$ but not $g_{\omega\alpha}$-dense in $X$, as $X_{\text{cl}(a, b)} \neq \{a, b\} \neq X$.

**Definition 3.8.** A topological space $X$ is called $g_{\omega\alpha}$-submaximal (resp. $g_{\omega\alpha}^*$-submaximal) if every $g_{\omega\alpha}$-dense (resp. $\alpha$-dense) subset is $g_{\omega\alpha}$-open in $X$.

**Proposition 3.5.** Every $g_{\omega\alpha}^*$-submaximal space is $g_{\omega\alpha}$-submaximal.

**Proof.** Let $X$ be a $g_{\omega\alpha}^*$-submaximal space and $A$ be a $g_{\omega\alpha}$-dense subset of $X$. By proposition 3.4, $A$ is $\alpha$-dense in $X$. By assumption, $A$ is $g_{\omega\alpha}$-open and hence $X$ is $g_{\omega\alpha}$-submaximal.

**Theorem 3.9.** Let $X$ be a $T_{g_{\omega\alpha}}$-space. Then $X$ is $g_{\omega\alpha}$-submaximal if and only if $P(X) = G_{\omega\alpha}\text{cl}(X)$.

**Proof.** Let $X$ be $g_{\omega\alpha}$-submaximal and $A \in P(X)$. Consider $V = A \cup (X - g_{\omega\alpha} - \text{cl}(A)) = X - (g_{\omega\alpha} - \text{cl}(A) - A)$. Then $g_{\omega\alpha} - \text{cl}(V) = X$. That is $V$ is $g_{\omega\alpha}$-dense in $X$. By assumption, $V$ is $g_{\omega\alpha}$-open. Then by theorem 3.6, $A \in G_{\omega\alpha}\text{cl}(X)$ and hence $P(X) = G_{\omega\alpha}\text{cl}(X)$.

Conversely, let $A$ be a $g_{\omega\alpha}$-dense set in $X$ and $P(X) = G_{\omega\alpha}\text{cl}(X)$. Since $A$ is $g_{\omega\alpha}$-dense, $g_{\omega\alpha} - \text{cl}(A) = X$. Then $A = A \cup \phi = A \cup (X - g_{\omega\alpha} - \text{cl}(A))$. Since $A \in G_{\omega\alpha}\text{cl}(X)$, $A = A \cup (X - g_{\omega\alpha} - \text{cl}(A))$ is $g_{\omega\alpha}$-open, by theorem 3.6. Hence $X$ is $g_{\omega\alpha}$-submaximal.

**Theorem 3.10.** Let $A$ and $B$ be any two subsets of $X$ and let $A \subseteq B$. Suppose that the collection of all $g_{\omega\alpha}$-open subsets of $X$ is closed under finite intersection. If $B$ is $g_{\omega\alpha}$-open and $A \in G_{\omega\alpha}\text{cl}^*(B, \tau \setminus B)$, then $A \in G_{\omega\alpha}\text{cl}^*(X)$.

**Proof.** If $A \in G_{\omega\alpha}\text{cl}^*(B, \tau B)$, then there exist $g_{\omega\alpha}$-open set $G$ in $(B, \tau B)$ such that $A = G \cap cl(A)$ where $cl(A) = B \cap cl(A)$. Since $G$ and $B$ are $g_{\omega\alpha}$-open then $G \cap B$ is $g_{\omega\alpha}$-open. This implies that $A = G \cap (B \cap cl(A)) = (G \cap B) \cap cl(A)$ is $g_{\omega\alpha}\text{cl}^*$ set in $X$. So $A \in G_{\omega\alpha}\text{cl}^*(X)$.

**Theorem 3.11.** If the collection of all $g_{\omega\alpha}$-closed subset of $X$ is closed under finite intersection if $B$ is $g_{\omega\alpha}$-closed, open in $X$ and $A \in G_{\omega\alpha}\text{cl}^*(B, \tau \setminus B)$ then $A \in G_{\omega\alpha}\text{cl}(X)$.

**Proof.** Let $A \in G_{\omega\alpha}\text{cl}^*(B, \tau B)$. Then there exist $g_{\omega\alpha}$-open set $G$ in $(B, \tau B)$ and closed set $F$ in $(B, \tau B)$ such that $A = G \cap F$. Since $F$ is closed in $(B, \tau B)$, $F = V \cap B$ for some closed set $V$ of $X$. So $V$ and $B$ are $g_{\omega\alpha}$-closed sets in $X$. Therefore $F$ is the intersection of $g_{\omega\alpha}$-closed sets $V$ and $B$. So $F$ is also $g_{\omega\alpha}$-closed set in $X$. Therefore $A = G \cap (V \cap B) \in G_{\omega\alpha}\text{cl}(X)$. 

4. $\omega \alpha g$ -Locally Continuous Functions

In this section, $\omega \alpha LC$ -continuous functions, $\omega \alpha LC^*$ -continuous functions and $\omega \alpha LC^{**}$ -continuous functions are defined and their properties are obtained. Also $\omega \alpha LC$ -irresolute functions, $\omega \alpha^*$ -irresolute functions and $\omega \alpha LC^{**}$ -irresolute functions are defined and their properties are discussed.

**Definition 4.1.** Let $f : X \to Y$ be a function. Then $f$ is called,

1. $LCg^\alpha$ -continuous if $f^{-1}(V) \subseteq G$ for each open set $V$ of $Y$.
2. $LCg^*$ -continuous if $f^{-1}(V) \subseteq G^*$ for each open set $V$ of $Y$.
3. $LCg^{**}$ -continuous if $f^{-1}(V) \subseteq G^{**}$ for each open set $V$ of $Y$.

**Theorem 4.1.** Let $f : X \to Y$ be a function. Then the following statements are true:

1. If $f$ is $\alpha LC$ -continuous then it is $LCg^\alpha$ -continuous, $LCg^*$ -continuous and $LCg^{**}$ -continuous.
2. If $f$ is $LCg^*$ -continuous or $LCg^{**}$ -continuous then it is $LCg^\alpha$ -continuous.

**Proof.**

1. Follows from the fact that every $lc\alpha$ -set is $lcg^\alpha$ -set, $lcg^*$ -set and $lcg^{**}$ -set by proposition 3.1.
2. Since every $lcg^*$ -set is $lcg^\alpha$ -set and every $lcg^{**}$ -set is $lcg^\alpha$ -set, the proof follows.

The converse of the above theorem need not be true as seen from the following example.

**Example 4.1.** Let $X = Y = \{a, b, c\}$ and $\tau = \{X, \{a\}, \{b\}, \{c\}\}$ and $\mu = \{X, \{a\}, \{b\}, \{c\}\}$. Let $f : X \to Y$ be an identity function then $f$ is $GoaLC$ -continuous, $GoaLC^*$ -continuous and $GoaLC^{**}$ -continuous but not $\alpha LC$ -continuous. Since for the open set $\{a, c\}$ in $Y$, $f^{-1}(\{a, c\}) = \{a, c\} \not\subseteq \alpha LC(X)$.

**Definition 4.2.** Let $f : X \to Y$ be a function. Then $f$ is called,

1. $GoaLC$ -irresolute if $f^{-1}(V) \subseteq G$ for each $V \in GoaLC(Y)$.
2. $GoaLC^*$ -irresolute if $f^{-1}(V) \subseteq G^*$ for each $V \in GoaLC^*(Y)$.
3. $GoaLC^{**}$ -irresolute if $f^{-1}(V) \subseteq G^{**}$ for each $V \in GoaLC^{**}(Y)$.

**Proposition 4.1.** Let $f : X \to Y$ be a $g\omega \alpha$ -irresolute map. If $B \subseteq GoaLC(Y)$, then $f^{-1}(B) \subseteq GoaLC(X)$.

**Proof.** Let $f : X \to Y$ be a $g\omega \alpha$ -irresolute function. Let $B \subseteq GoaLC(Y)$. Then there exist a $g\omega \alpha$ -open set $G$ and a $g\omega \alpha$ -closed set $H$ such that $B = G \cap H$ which implies that $f^{-1}(B) = f^{-1}(G) \cap f^{-1}(H)$. Since $f$ is a $g\omega \alpha$ -irresolute, $f^{-1}(G)$ and $f^{-1}(H)$ are $g\omega \alpha$ -open and $g\omega \alpha$ -closed in $X$ respectively. Hence $f^{-1}(B) \subseteq GoaLC(X)$.

**Theorem 4.2.** Let $f : X \to Y$ be a $g\omega \alpha$ -irresolute. Then $f$ is $GoaLC$ -irresolute.

**Proof.** Follows from the above proposition 4.1.

The converse of the above proposition need not be true as seen from the following example.

**Example 4.2.** Let $X = Y = \{a, b, c\}$ and $\tau = \{X, \{a\}, \{b\}, \{c\}\}$ and $\mu = \{X, \{a\}, \{b\}, \{c\}\}$. Let $f : X \to Y$ be an identity function then $f$ is $GoaLC$ -irresolute, but not $g\omega \alpha$ -irresolute. Since for the $g\omega \alpha$ -closed set $\{b, c\}$ in $Y$, $f^{-1}(\{b, c\}) = \{b, c\}$ is not $g\omega \alpha$ -closed in $X$.
Theorem 4.3. If \( f : X \to Y \) is \( G_\omega \alpha \omega L C \)-continuous (\( G_\omega \alpha \omega L C^* \)-continuous or \( G_\omega \alpha \omega L C^{**} \)-continuous) and \( X \) is a \( T_{g\alpha} \) then \( f \) is \( \alpha L C \)-continuous.

Proof. Let \( f : X \to Y \) be \( G_\omega \alpha \omega L C \)-continuous and \( V \) be an open set in \( Y \). Since \( f \) is \( G_\omega \alpha \omega L C \) (\( G_\omega \alpha \omega L C^* \), \( G_\omega \alpha \omega L C^{**} \)) continuous, \( f^{-1}(V) \) is \( g\omega\alpha \omega L C \)-set (\( g\omega\alpha \omega L C^* \)-set, \( g\omega\alpha \omega L C^{**} \)-set) in \( X \). Since \( X \) is \( T_{g\alpha} \)-space, \( f^{-1}(V) \) is \( \alpha L C \) set in \( X \). By proposition 3.2. Hence \( f \) is \( \alpha L C \)-continuous.

Theorem 4.4. Any function defined on an \( \alpha \)-door space is \( G_\omega \alpha \omega L C \)-irresolute.

Proof. Let \( f : X \to Y \) be a function where \( X \) is an \( \alpha \)-door space and \( Y \) is any space. Let \( A \in G_\omega \alpha \omega L C(Y) \). Then by assumption on \( X \), \( f^{-1}(A) \) is either \( \alpha \)-open or \( \alpha \)-closed. Since every \( \alpha \)-closed set is \( g\omega\alpha \omega \omega \alpha \)-closed, \( f^{-1}(V) \in G_\omega \alpha \omega L C(X) \). Therefore \( f \) is \( G_\omega \alpha \omega L C \)-irresolute.

Theorem 4.5. Let \( X \) be a \( T_{g\omega} \)-space. If \( X \) is \( g\omega \alpha \omega \omega \alpha \)-submaximal then every function having \( X \) as its domain is \( G_\omega \alpha \omega L C \)-irresolute.

Proof. Let \( X \) be \( T_{g\omega} \)-space and \( g\omega \alpha \omega \omega \alpha \)-submaximal. Let \( f : X \to Y \) be any map. Then by theorem 3.9 \( P(X) = G_\omega \alpha \omega L C(X) \). If \( U \) is \( g\omega\alpha \omega L C \)-set of \( Y \), then \( f^{-1}(V) \in P(X) = G_\omega \alpha \omega L C(X) \) and hence \( f \) is \( G_\omega \alpha \omega L C \)-irresolute.

Theorem 4.6. Let \( f : X \to Y \) and \( g : Y \to Z \) be any two maps. Then,

1. \( g \circ f : X \to Z \) is \( G_\omega \alpha \omega L C \)-irresolute (resp. \( G_\omega \alpha \omega L C^* \)-irresolute, \( G_\omega \alpha \omega L C^{**} \)-irresolute) if \( f \) is \( G_\omega \alpha \omega L C \)-irresolute (resp. \( G_\omega \alpha \omega L C^* \)-irresolute, \( G_\omega \alpha \omega L C^{**} \)-irresolute) and \( g \) is \( G_\omega \alpha \omega L C \)-irresolute (resp \( G_\omega \alpha \omega L C^* \)-irresolute, \( G_\omega \alpha \omega L C^{**} \)-irresolute).

2. \( g \circ f : X \to Z \) is \( G_\omega \alpha \omega L C \)-continuous if \( f \) is \( G_\omega \alpha \omega L C \)-irresolute and \( g \) is \( G_\omega \alpha \omega L C \)-continuous.

Proof. (i) Let \( V \in G_\omega \alpha \omega L C(Z) \) (resp. \( V \in G_\alpha \omega L C^*(Z) \), \( V \in G_\alpha \omega L C^{**}(Z) \)). Since \( g \) is \( G_\omega \alpha \omega L C \)-irresolute (resp. \( G_\alpha \omega L C^* \)-irresolute, \( G_\alpha \omega L C^{**} \)-irresolute), \( g^{-1}(V) \in G_\omega \alpha \omega L C(Y) \) (resp. \( g^{-1}(V) \in G_\alpha \omega L C^*(Y) \), \( g^{-1}(V) \in G_\alpha \omega L C^{**}(Y) \)). Since \( f \) is \( G_\omega \alpha \omega L C \)-irresolute (resp. \( G_\alpha \omega L C^* \)-irresolute, \( G_\alpha \omega L C^{**} \)-irresolute), \( f^{-1}(g^{-1}(V)) = (g \circ f)^{-1} \in G_\omega \alpha \omega L C(X) \) (resp \( f^{-1}(g^{-1}(V)) = (g \circ f)^{-1} \in G_\alpha \omega L C^*(X) \), \( f^{-1}(g^{-1}(V)) = (g \circ f)^{-1} \in G_\alpha \omega L C^{**}(X) \)). Therefore \( g \circ f \) is \( G_\omega \alpha \omega L C \)-irresolute (resp \( G_\alpha \omega L C^* \)-irresolute, \( G_\alpha \omega L C^{**} \)-irresolute).

(ii) Let \( V \) be any open set in \( Z \). Since \( g \) is \( G_\omega \alpha \omega L C \)-continuous, \( g^{-1}(V) \in G_\omega \alpha \omega L C(Y) \). Since \( f \) is \( G_\omega \alpha \omega L C \)-continuous, \( f^{-1}(g^{-1}(V)) = (g \circ f)^{-1} \in G_\omega \alpha \omega L C(X) \). Therefore \( g \circ f \) is \( G_\omega \alpha \omega L C \)-continuous.
