Keywords: Ethnomedicine, Argentina, Wormers.

Abstract. Plants are different all over the world and its indications change according to the country they are located. This paper is developed in order to perform a comprehensive literature's review about plants used as anti-parasitic either in traditional or popular medicine in Argentina, and to provide a scientific support for their use in this medical indication. All Ethnobotany, Ethnomedicine, Phytomedicine books from Libraries of the Faculty of Exact Sciences Faculty of Medical Sciences, Agricultural Science, from all National Universities in Argentina were included in the study. Herbal characteristics and therapies were searched in online databases such as Medline PubMed, Science Direct and Scopus. The results obtained show the potential of Ethnomedicine in Argentina as a source of active ingredients for phytotherapy, providing data about species for anti-parasitic treatment. Thus, we found many Argentinean's plants with anti-parasitic properties which might be considered alternatives for natural treatment or future drug development against wormers.

Introduction

Traditionally plants coming from each geographic region of the world had been used for medical purposes for several centuries. This knowledge has been maintained through oral transmission from generation to generation [1].

But this information is rapidly disappearing due to the adoption of measures from new modern culture that displaced the traditional wisdom.

The importance of documenting this knowledge derived from technological changes, or people's socio-economic features, which led to a disuse or total loss of traditional knowledge [2]. Noteworthy, this interest in herbal medicine has increased in the last years.

Pharmaceutical companies focus their attention in the research of new molecules, since classical treatments usually develop resistance. This is the case of anti-parasitic drugs. The last decades were marked by a progressive increase in drug resistance and in rising of the costs of therapies. The research and development of new knowledge about herbs is not longer an option but a necessity.

Herbal medicine then poses as one of the best options for the control of disease resistant to conventional drugs [3].

Medicinal plants are defined by the World Health Organization (WHO) as "any plant species in which all or a portion of it has pharmacological activity" or by the Pharmacopoeia VII edition 2002 first volume (FA 7) - plants or ground whole or ground parts (flowers, fruits, seeds, tubers, bark, etc.) fresh or dried and juices, gums, latex, essential oils and other fixed or similar components, which are used pure or mixed on drug development " [4,5].

The use of coded free vegetable or dispensing medicinal purposes is an established practice in Argentina and has been significantly increased in the past 3 decades [6]. Medicinal plants in Argentina used for therapeutic purposes are included in drug's category; therefore it becomes necessary to guarantee their quality, safety, and effectiveness [6]. Consequently, both health authorities and users needs information concerning about safety and quality of herbal medicines [4] and, in order to ensure continuous, affordable and sustainable supply of medicinal plant materials, it is suitable to demand good quality publication on medicinal plants [5].

In Argentina, parasites are considered a severe problem. It exist frequent resistance for classic antiparasitic treatment. On the other hand, Ethnomedicine studies are still scarce. Therefore it is demanded to count with Ethnomedicine information as a starting point for future studies and for Pharmacognosy and Pharmacologic trials, in order to justify their use. In this sense, the World Health Organization itself recognizes the important dimension of medicinal plants as a therapeutic resource, especially in Primary Health Care, existing thereon documents issued by this entity such as monographs, standards of practice of growing and processing products as well as the basis for clinical trials with herbal medicines [5].

Perhaps the inability to patent these products does not motivate the pharmaceutical industry to focus its immense economic flow to them. However, it is also true that the pharmaceutical industry itself is today a true crossroads, unable to find or synthesize all new products the Society needs, so, rediscover new uses for these old natural molecules is not so bad idea. This leds into take a new look about the industry to this type of resource, where there are thousands of undiscovered properties of not so well known regional plants. In the work, we explored the available data of herbs with parasiticide properties, located in Argentina.

Material and Methods

Geographical area of the study.

The study area encompasses Argentina territory. The country develops in a physical environment with great diversity of customs, impacting directly on the diversity of plants and treatments; along with a wealth of behavior you inherit immigrants.

It was also considered for this paper that Argentina is a country with a variety of climates, regions, vegetation and diversity of practice in the medical use.

Collection of information

The work has been carried out by the search and bibliographic review of the literature on Ethnomedicine, ethnoveterinary, Ethnobotany, Pharmacognosy and Phytomedicine topics. Only it has been collected herbal data that had explicit references to it use as antiparasitic, insecticides and insect repellents, discarding all those uses related to magical or superstitious nature or those refered to its use as antiparasitic purgative laxative effect such as gel *Aloe vera*, *Rhamnus frangula* bark L., *R. Prussian* D. L., or oil from *Ricinus communis*.

Data Sources

Data about the antiparasitic effects of the herbs studied was obtained exploring Scopus data base, Pubmed, Phytomedicines and Pharmacognosy and Phytotherapy books (either from libraries or on line versions). Formulary Prescription gathering medicinal herbs with antiparasitic uses was extracted from scientific community database.

Results

Species and botanical families

The data concerning species and families is shown in Table 1. However complete information including plant's features and indications is shown in table 2. This data reflect the use of species belonging to 25 families, knowing that many species belongs to few families (Figure 1).

50 species belonging to 25 families were studied. Only 4 of them were found in the official Pharmacopeia Drug Edition in Argentina. 12 of the plants studied are banned because of their toxicity and 4 are considered highly toxic but its use is still allowed. Considering the popular knowledge and alternative practices gave us a better understanding of human interactions with their local environment and helps us to obtained appropriate data for validation of traditional uses.

Table 1. Families Names

Scientific name	Local common name	Family
<i>Allium sativum</i> L.	Garlic	Liliaceae
<i>Artemisia abrotanum</i> L.	Abrótano male	Asteraceae
<i>Artemisia absintium</i>	Wormwood	Asteraceae
<i>Artemisia matitima</i> L.	Wormwood Maritime	Asteraceae
<i>Artemisia mendozana</i> D.C	Wormwood Mendozino	Asteraceae
<i>Artemisa vulgaris</i> , <i>A. herba</i>	Artemis	Asteraceae
<i>Asclepia curassavica</i>	Spanish flag	Asclepiadaceae
<i>Atractylis gummifera</i> L.	League	Asteraceae
<i>Castela erecta</i> ssp	Chaparro bitter	Lorantaceae
<i>Chenopodium ambrosioides</i> L.	Quenopodio, Piako,	Amaranthaceae
<i>Cinchona</i> sp.	Quina	Rubiaceae
<i>Combretum micranthum</i> L.	Combreto	Combretaceae
<i>Cominum cyminum</i> L.	Cumin	Umbelíferas
<i>Curcubita pepo</i> L.	Pumpkin	Cucurbitaceae
<i>Daucus carota</i>	Carrot	Umbelíferas
<i>Delphinium staphisagria</i> L.	Kills lice, swallow foot	Ranunculaceae
<i>Eucalyptus globulus</i>	Eucalyptus	Myrtaceae
<i>Eugenia caryophyllus</i>	Clove	Myrtaceae
<i>Eugenia uniflora</i>	Pitanga	Myrtaceae
<i>Eupatorium cannabinum</i> L.	Cañamo	Asteraceae
<i>Hordeum vulgare</i> L.	Barley	Poaceae
<i>Hydrastis canadensis</i>	Goldenseal	Ranunculaceae
<i>Inula helenium</i> L.	Elecampane, Grass Moor	Asteraceae
<i>Juglans regia</i>	Walnut	Asteraceae
<i>Matricaria chamomilla</i>	Chamomile	Asteraceae
<i>Melaileuca cajeputi</i> Powell	Cayeput	Myrtaceae
<i>Melaleuca leucadendron</i>	Niaouli, Cajeput,	Myrtaceae
<i>Mentha Piperita</i>	Mint	Lamiaceae
<i>Mentha pulegium</i> L.	European pennyroyal	Lamiaceae
<i>Mentha spicata</i>	Peppermint	Lamiaceae
<i>Myroxylon balsamiferum</i>	Balsam of Peru	Fabaceae
<i>Nephrodium</i>	Bracken fern	Polipodiaceae
<i>Nicotiana glauca</i> Graham	Palán-Palán	Solanaceae
<i>Nicotiana tabacum</i>	Tobacco	Solanaceae
<i>Petiveria alliacea</i>	Bull grass	Phytolaccaceae
<i>Pimpinella anisum</i> L.	Green anise	Umbelíferas
<i>Podophyllum peltatum</i> L.	Podophyllum	Berberidaceae
<i>Portulaca oleracea</i> L.	Purslane	Portulacaceae
<i>Punica granatum</i> L.	Pomegranate	Lythraceae
<i>Quassia amara</i>	Quassia bitter, bitter post	Simaroubaceae
<i>Rosa gallica</i> L.	Rosebush	Rosáceas
<i>Ruta chalepensis</i>	Ruda	Rutaceae
<i>Santolina chamaecyparissus</i>	Abrótano hebra	Asteraceae
<i>Schkuhria pinnata</i> O. Kuntze	Kills fleas	Asteraceae
<i>Senecio jacobaea</i> L.	Ragwort	Asteraceae
<i>Tanacetum cinarariae folium</i>	Pyrethrum	Asteraceae
<i>Tanacetum vulgare</i> L.	Tansy	Asteraceae
<i>Thuja occidentalis</i> L.	Tuya	Cupressaceae
<i>Thymus vulgaris</i>	Thyme	Lamiaceae
<i>Verbena officinalis</i> L.	Verbena	Verbenaceae

Figure 1. Species according to their families

Table 2 shows a complete data about authors who support its antiparasitic use. It is also been detailed, the part of the plant used, its official use, if the herbs are classified as toxic, and their active ingredients and their possible dosage.

Although the plants are now growing in the Argentine territory, it was explored the original source of them, and this data is shown in figure 2.

Figure 2. Original source of Argentinean Plants

Table 2 Indication, Composition and way of use

Scientific name/ Reference	FA	Part Tox	Part used	Origin	C o C	Indication	Composition	Way of use
<i>Allium sativum</i> L. (6,9,11, 12)	Of	PE	B	Asc	1	Intestinal antiparasitic (Oxyuriasis); worming (amebicida, y antihelmíntico). Intestinal Entamoebahistolytica, haemonchus contortus; Giardiaintestina-lis, Giardialamblia (Giardiaduodenalis), Leishmaniamajor, Leptomonascolosoma, Crithidiafasciculata, cryptosporidium baileyi, Tetratrichomonasgallinarum, Histomona smeagregidis Plasmodium berghei Trypanosoma brucei brucei, T. brucei rhodesiense, T. brucei gambiense, T. brucei congolense, T. evansi, T. equiperdum T. cruzi	Allicin and allyl acid	Ingestion of raw bulbs (cooked loses more than 90% effective); along the high lemon or mixed with milk. Very effective against the treatment of worms
<i>Artemisia abrotamum</i> L.(7,12)	Of	PA	H, SF	Em	1-2	Anti-helminthic, mosquito repellent	epoxyocimene and chrysanthenyl acetate	oils obtained by hydrodistillation of aerial parts
<i>Artemisia absintium</i> (11,12, 16,21)	Tox	PE	H; SF	E	1 -2	Malaria, insect repellent, pesticide. Worming (expels parasitic) for worms and intestinal worms.	Artemetin (antimalarial), Beta-tujon, (Insect repellent, pesticide).	Infusion, 2 g/L; children and adults, 10 g/L. 300 a 400 ml per day divided into 3 doses.
<i>Artemisia maritima</i> (7)	Of	PA	SF	E	1	Oxyuriasis and Ascaricida	camphor and 1,8-cineole	Infusions of leaves and flowering tops
<i>Artemisia mendozaana</i> D.C (21)	Of	-	H SF	A	1-2	Intestinal antiparasitic and worming	camphor, artemiseole, artemisia alcohol and borneol	Infusion (15 g /L)
<i>Artemisa vulgaris</i> , <i>A. herba alba</i> (22, 24)	Of	-	PE	E As	1-2	Intestinal antiparasitic	Terpenes and derivatives 1,8 cineol, camphor, linalool, thujone, 4-terpineol, borneol, cardinol, and sesquiterpenes	Infusion (30 g /L of hole plant)
<i>Asclepias curassavica</i> (25)	Tox	PE	R, T; H	A	1	Antiparasitic, insecticidal and anthelmintic.	Digital (toxic glucoside) asclepiadea and vicentoxina	Infusion of leaves (antiparasitic), diluted latex (insecticide and anthelmintic)
<i>Atractylis gummifera</i> L. (27)	Tox	R	PE	E	1-2	Repellent, insecticide	Glycosides diterpenes: atractyloside (ATR) y carboxi-atractiloside	Infusion 30gr/L
<i>Castela erecta</i> ssp (42)	Of	-	A	A	1-2	Antiparasitic effective in adult parasite and its status as a cyst in intestinal mucosa	α -terpinene, camphor, trans-ascardiol, p-cymene, pinocarvone, α -pinene (3.57%) and geraniol	Oil 6 gr/L
<i>Chenopodium ambrosioides</i> (7,29,47)	Tox	PE	H, F	A	1	Internal, anthelmintic, antiparasitic hookworms, roundworms, and oxyruvermicularis ascarislumbricoides. External use as antisárnica, antiparasitic and flea scalp.	(Z)-ascarirole, 2-carene, p-cymene, isoascarirole and α -terpinene	Decoction not more than 5 g per day; for 3 days (internal parasite), external use (antisárnica and antiparasitic scalp); in soils as flea

<i>Cinchona sp</i> (7,23,32)	Of	-	R	A	1	Antihelmintic, malaria. In veterinary medicine, as anti-louse.	quinine	Infusion 30 gr/L
<i>Cuminum cyminum L.</i> (7,12)	Of	-	F	AfAsm	1	Antihelmintic	Cuminal, cuminic alcohol, γ -terpinene, safranal, <i>p</i> -cymene and β -pinene	Infusion 2%
<i>Curcubita pepo L.</i> (7,11,18,21)	Of	-	S	A	1-2	Intestinal anthelmintic, <i>Taeniaspp</i> , <i>Hymenolepis</i> spp, <i>enterobius</i> spp, <i>Ascaris</i> , <i>spp</i> .	Curcubidine, ac. Linoleic y acoleic, carotenoides , vit E.	-100g Seeds in milk -cucurbitita fasting. -60 G of crushed seeds, 40 g sugar, 60 mL of water; boil for 20 min, mix without strain. 1 x day followed purgative
<i>Daucus carota</i> (21)	Of	-	R	Asc	1-2	Antihelmintic	Carotol, daucene, farnesene, germacrene	The root raw, grated, at the rate of half a kilo to a kilo for 24 hours. At this time should not eat any other food. Failing that, you can take two carrots daily fasting for a week.
<i>Delphinium staphisagria</i> <i>L.</i> (7,11,34)	Tox	PE	S	E	1-2	Antiparasitic Chagas (flavonoids); pediculosis (alkaloid is curarizing), external parasiticide (toxic), as external scabies and lice	Alcaloides; metil- licaconitina	Decoctions seeds, external parasiticide
<i>Eucalyptus globulus</i> (7,18)	Of	-	H -A	Au	1	Anthelmintic	Eucaliptol y alfa pineno, ácido caféico y gálico	Tincture
<i>Eugenia caryophyllus</i> (12)	Of	-	SF	As	1-2	Acaricidal and anthelmintic low power	eugenol	Dried flowers 4 g / 250 ml of boiling water; 15 ml per day per 11 kg of body weight for 2-3 days; soaked for 10-20 min.
<i>Eugenia uniflora</i> (40,41)	Of	-	PE	A	1	Antihelmintic	Lycopene, terpene compounds, oxalic acid, chlorogenic acid, pitagina, cineole, beta carotene, citric acid.	20g/ L of water
<i>Eupatorium cannabinum L</i> (7)	Tox	PE	PE	Em	1-2	Antihelmintic, diuretic	Lactonassequiterpénicas (eupatoriopirina) alcaloids (equinatina, licopsamine, intermedine, rinderine y supinine.	5 g of leaves /300 ml of water
<i>Hydrastis canadensis</i> (7)	Tox	R	H	A	1	Antiparasitic	hidrastina y laberberina	5 g /100 ml
<i>Inula helenium</i> <i>L.</i> (7,8)	Of	-	R	Ac	1-2	Intestinal antiparasitic	Sesquiterpene, triterpene alcohols, inulin, helenina, azulene, sterols, fructans and mucilage, essential oil (camphor énula)	Roots and rhizomes. Decoction, extracts, ointment, powdered drug, essential oil obtained by distillation. Dry extract (5: 1) 300- 900 mg / day
<i>Juglans regia</i> (7,11,12,21)	Of	-	H	Ac	1	Insect repellent; anthelmintic against <i>Haemonchus contortus</i>	Tannins (gallic and catéquinos): naphthoquinones (junglona)	Decoction of 70g in 1000cc of water, against the lonely and to combat chilblains. Environmental /

<i>Matricaria chamomilla</i> (32,40)	Of	-	SF	E	1-2	Antihelmintic	Flavonoids, apigenin and luteolin, free and as heteroside	5 g /100 ml
<i>Melaleuca leucadendron</i> (7)	Of	-	H	Au	1-2	Scabies and pediculosis	1,8-cineol, nerolidol, alloaromadendrene y α -terpineol	Environmental / repellent
<i>Mentha piperita</i> (12,32)	Of	-	H SF	Em	1	Ectoparasitocidal, helminths (worms and other antiparasitic digestive), worming.	Essential oil (menthol, menthone, methyl acetate, mentafurano, isomenthone, pulegone, piperitone, cineol, limonene), flavonoids (apigenol, luteol, rutoside, mentósido) ácidosfenólicos (caffaic, chlorogenic, rosmarinic), tannins, triterpenes (ácidosursólico, ácidooleanílico)	Environmental / repellent
<i>Mentha pulegium L.</i> (7)	Tox	H, A	SF, H	E	1	insect repellent	Essential oil (pulegone, 1-menthone, d-isomenthone, piperitone, piperitenone, isopiperitenona), alcohols (menthol, 3-octanol), esters (menthyl acetate), hydrocarbons (alpha and beta-pinene, limonene, p-cymene, dipentene, camphene)	Essential oil -1-2gts / 12hs- Infusion 1cda / cup; take 2-3tazas / day; Environmental / do bunches, repellent
<i>Mentha spicata</i> (32)	Of	-	H	E	1	worming	alpha-pinene, limonene, l-carvone and ketone.	oral
<i>Myroxylon balsamiferum</i> (7)	Of	-	SF	A	1	scabies, lice, mites	Cinnamine, benzoate, cinamate benzile, nerolirol & peruviol	15 g with 19 g of ricine oil and 75gr vaseline (external use)
<i>Nephrodium</i> (11)	Of	-	R	A	1-2	Anthelmintic, tapeworm.	quinoid, albaspidine, tris-para-aspidine, philixic acid, flavaspidic, tetra-flavaspidic, aspidinole, filicine, filicilic acid & flavaspidic acid	Manage capsule ether extract of male fern, administered one capsule every 10 minutes and one hour after taking a saline cathartic, never oily.
<i>Nicotiana glauca</i> Graham (42,44)	Of	-	H	A	1-2	Ectoparasitocidal and anthelmintic	Anabasine, piperidina, nicotine, normicotine, citric, succinic, malic and oxalic acid and rutin.	brews; toxic
<i>Nicotiana tabacum</i> (12,46, 47,48)	Tox	PE	H	A	1-2	Scabies; leeches, ectoparasitocidal and helminths.	Nicotine; Anabasine, piperidine nicotine, normicotine and N-methyl anabasine	Dust; 0,2-2g / day divided into 3 doses; Infusion 1cda / 3tazas / day; 1-2gts essential oil / 8-24hs (no more than 5gts per sample)
<i>Petiveria alliacea</i> (24)	Of	-	R, T	A	1	Scabies, worming	benzaldehyde, benzoic acid, benzyl 2-hydroxyethyl trisulphide, coumarin, isoarborinol, isoarborinol acetate, isoarborinol, cinnamate, isothiocyanates, polyphenols, senfol, tannins, trithiolaniacin	30g of roots in one litre of water

<i>Pimpinella anisum</i> L. (7)	Of	-	F	A	1	Anti-worms	Essential oil (t-anethole, estragole, anisaldehyde), furanocumarinas (umbelliferone), terpene hydrocarbons, stigmasterol, flavonoids (quercitrósido, isoorientin, vitexin, rutin), choline, malic acid	Infusion 1 tablespoon / 3 cups / of; 1-2gts essential oil / 8-24hs (no more than 5gts per sample)
<i>Podophyllum peltatum</i> L. (7,49)	Tox	R	H,T;R	A	1-2	Anthelmintic (anti-worm)	Podophyllum resin (lignans [podophyllotoxin picropodophyllin, peltatin alpha, beta-peltatin] heterósidosglucosides)	Decoction of the root bark as tenifugo, accompanied by a purgative to cause the expulsion of tapeworm
<i>Portulaca oleracea</i> L. (7,28)	Of	-	sumo	As	1	anthelmintic	oleraceínas A, B, C, D y E; diterpenoide portulene, lupeol, betasitosterol y daucosterol	2.5 mg of leaves/100ml water, 80mg of seeds/100ml.
<i>Punica granatum</i> L. (7,11,23)	Of	-	R,T,F	As	1-2	Tenias, intestinal antiparasitic, Vermifuge, amebicide, tapeworm, intestinal worms.	Alkaloids, less in the fruit (peletierina, isopeletierina, pseudopeletierina, N-metilpeletierina) hydrolysable tannins (3,6-hexahidrofenoilglucosa, granatinas A and B, punicafolina, punicacorteínas A, B and C, punigluconina, punicalin, punicalagin)	worming; 60 g of root bark or stem / water 500 ml of macerate for 24 hours, boiled to reduce the volume to half. Take fasting. After an hour and a half, catharsis because it tends to dry the belly.
<i>Quassia amara</i> (29)	Of	-	R, T	A	1-2	Intestinal worms and insecticide (mites, beetles, Hemiptera, Hymenoptera, Lepidoptera and thisanópteros) Plasmodiumyoelii and P. falciparum.	quasinoides, simalikalactone D	Infusion: 1-4 g cup. Tincture: 25 gts, three times a day
<i>Ruta chalepensis</i> (11,50)	Tox	PA	PA	E	1-2	intestinal worms	nonylmethyl ketone; glucoside routine and essential oil. Gums, resins, tannin materials	1 kg of whole plant in 1 litre of boiling water.
<i>Santolina chamaecyparissus</i> (7)	Of	-	T	E	1-2	Aphid repellent; Anthelmintic (to eliminate intestinal antiparasitic) of children.	artemisia ketone, camphor, and β -phellandrene	Repellent infusion leaves
<i>Schkuhria pinnata</i> O. Kuntze (7)	Of	-	PE	E	1-2	Insecticide; antimalarial	sesquiterpene lactones; heliangolide	15 g of leaves in 1 litre of water
<i>Senecio jacobaca</i> L. (7,51)	Tox	PE	SF	E	1-2	Anthelmintic	Metilheptilcetona, l-apinen, cineol, l-limoneno y metil-n-nonilcarbinol.	internal use. Infusion 1 tablespoon / 150ml, 3 cups / day, essential oil 1-5gts (25-50mg) / 8 hours after meals
<i>Tanacetum cinerariae-folium</i> (7,32)	Tox	SF	SF	As	1-2	Antiparasitic, insecticidal	essence; esters (piretrolona, cinerolona and jasmolona)	alcoholic solutions, lotions and shampoos.
<i>Tanacetum vulgare</i> L. (7,40)	Tox	SF	SF	Eu	1-2	Insecticidal	1,8-cineole, trans-thujone, camphor and myrtenol	aerial parts in bundles to insects, environmental use

<i>Thuja occidentalis</i> L (7,52).	Tox	PA	T	A	I	Anthelmintic, insecticide	Alpha-thujone	20g of leaves in 1 litre of boiling water
<i>Thymus vulgaris</i> (7,53)	Of		H, SF	E y Af	I	intestinal antiparasitic	Essential oil (thymol, carvacrol, p-cymene, beta-pinene, borneol, linalool, geraniol, terpineol, t-tuayanol-terpineol) ácidotriterpénicos (urólico, oleanolic), ácidocafeico, ácidorosmarínico, flavonoids (luteolin, tetrahydroxy-5,7, 3', 4'-flavone), triterpene saponins, tannins	Infusion 5% 2-3 cups a day. Essential oil; 1-5 drops per dose, on a sugar cube or in aqueous solution
<i>Verbena officinalis</i> L. (23)	Of		H, T	E	I	Antihelmintic	β-sitosterol, ursolic acid, oleanolic acid, 3-epiursolic acid, 3-epioleanolic acid, iridoid glucosides (verbenalin & hastatoside), phenylpropanoid glycoside, verbascoside and β-sitosterol-D-glucoside	Infusion 25g in one liter of water

FA: As listed in the pharmacopoeia Argentina 8th Ed. Official drug (Of) or Toxic Drugs (Tox).Toxic or part as Official Drug Formulary = R: root; PE: whole plant; PA: aerial parts; H: leaves; A: oils
Part used = B: bulbs; S: seeds; SF: flowering tops; F: fruit, T: branches and stems. Originally = E: Europe; A: America, Af: Africa; As Asia; Asc: Central Asia; Au: Australia; Em: Mediterranean Europe;
C and / or C: crop growth in Argentina: 1: those species that grow naturally or spontaneously. 2: those that are grown.

The sources used:

We have observed an extensive use of plants that have European origins, maybe based in the fact that Argentine population has their roots predominantly in European countries like Italy and Spain. Mediterranean area of these countries has similar climate, temperature and humidity than vast areas of Argentina (figure 2).

The main part used from plants were leaves, stems, whole plant, seeds, aerial parts, flowering tops, fruits, root, oil or juice (Table 2, Figure 3).

Figure 3. Part of the plant used

Analysis of the most significant plants

The bulb of *Allium sativum* L. known as the "Garlic" belonging to the family of a liliáceas shown to have activity against different parasites [7] intestinal parasites (oxyuriasis) [8-10], or intestinal worms [11]. Its effectiveness is due to the presence of the allylic and acid allicin, which would confer the amebicide and anthelmintic properties.

Experiments with intestinal *Entamoeba histolytica* parasite have shown that pure allicin inhibits histopathological effects associated with infection and parasite growth; effective against

Haemonchus contortus in ruminant hosts; diluted cryptosporidium parasites in humans in preliminary tests; inhibits *Entamoeba histolytica* growth trophozoite in vitro.

Whole garlic extract demonstrated anti-Giardia effectiveness and activity against other microaerophilic flagellate intestinalis [12]. Allicin diallyl trisulfide product (DAT) and ajoene, inhibits the growth of different protozoan parasites, including *Giardia lamblia* (*Giardia duodenalis*), *Leishmania major*, *Leptomonas colosoma*, *Crithidia fasciculata*, *Cryptosporidium baileyi*, *Tetratrichomonas gallinarum*, *Histomonas meleagridis* *Plasmodium berghei* *Trypanosoma brucei brucei*, *T. brucei rhodesiense*, *T. brucei gambiense*, *T. brucei congolense*, *T. evansi*, *Tequiperdum* . and *T. cruzi*.

Ajoene is effective against *T. cruzi* epimastigotes and amastigotes. With such trypanocidal activity, garlic derivatives could be used as an alternative treatment for African-trypanosomiasis, considering that current drugs for brain infections (sleeping sickness) are extremely toxic.

The mechanism of action of the allicin and ajoene is through its interaction with thiol groups present on enzymes, inhibiting cysteine proteases, alcohol dehydrogenases and thioredoxin reductases of parasites like *E. histolytica*. Ajoene in the *T. cruzi* inhibits proliferation, possibly by inhibiting the biosynthesis of phosphatidylcholine, by interfering with traffic of proteins and lipids in the cell membranes of the parasite. Ajoene inhibits the final stage of the biosynthesis of phosphatidylcholine and modifies the composition of the cell membrane phospholipids [13]. Many polyphenols (hydrolysable tannins, proanthocyanidins, caffeic acid products) demonstrated to reduce intracellular survival form of *Leishmania donovani* amastigotes in vitro. The effects of polyphenols against intracellular parasites of *Leishmania* are due to the activation of macrophages rather antiparasitic activity [9, 14, 15].

Within the genus *Artemisia*, belonging to the family of asteraceae we identified 5 species with antiparasitic properties including the popularly known since ancient times *Artemisia absintium*. But it is noteworthy that the similarity between them allows the use of one specie instead of the other.

The leaves and flowering tops of *Artemisia absintium* commonly known as "Wormwood" in the family of asteraceae possess a demonstrated antimalarian effect in countless articles. It has Beta-thujone, which gives it a pesticide and insect repellent effect. The sesquiterpene lactones, would serve to combat intestinal parasites, but their use is limited because its toxicity. It has been used for centuries as an anthelmintic, especially against roundworms and earthworms [11]. Since the essential oil is volatile, and absintine contains thujone, the product is extremely powerful, so, even at very low doses, it may cause coma or death in adults. For this reason, it is preferred to use dried plant material instead of essential oil [12, 16]. It should be keep in mind that in the Pharmacopoeia Argentina VIII edition, this plant drug is classified by its toxic properties.

Popularly, wormwood tincture of *Artemisia* is used for other purposes, such as hallucinogen.

Artemisia contains santonin which has a selective toxic action on the node located in the nerve ring of *Ascaris* spp. However, its narrow range of activity does not include *Oxyuris* spp. or tapeworms [11, 17].

It is published that the aerial parts of this family of plants are effective against nematodes and worms (20-30 g aerial parts in 500 ml of boiling water for 20 minutes, cool, strain and take 15ml / kg body weight). The sweet wormwood (*Artemisia annua*) has less negative components of *A. absinthium* [12].

On the other hand, the infusion of the leaves and stems has proven its action against amoeba (*Entamoeba histolytica*) (2 g / L, children and adults, 10 g / L. In all cases take 300 to 400 mL per day in 3 divided doses). It should be noted that the essential oil contains highly toxic substances foliage, so, not controlled use can cause vomiting, dizziness, seizures, hallucinations, disorders of sensation and other severe diseases of the CNS if doses are exceeded [18].

Annua, used in the Río de la Plata because its antiparasitic properties, is active in wild wormwood. [12, 19]. It is also used in Chinese medicine for its proven activity as antimalaric against *Plasmodium falciparum* [20].

The leaves, flowering tops and essence of *Artemisia abrotanum* L. popularly known as "Abrotane male", is given a high level of effectiveness and its use as an anthelmintic [6, 7, 12].

Infusions of leaves and flowering tops of *Artemisia mendozana* are well known because of its vermifuge properties against wormwood for intestinal parasitism treatment [21].

Literature also mentions its use by Mapuche's communities of NW Patagonia. The flowering tops of *Artemisia maritima* L. popularly known as "Wormwood Maritime" has been shown to be active against threadworm and ascaris but its toxicity is similar to castor oil [7] and can produce visual disturbances as side effects.

The oil obtained by distillation of whole plant of *A. herba albay vulgaris* popularly known as "Artemis", is an essential oil that contains plenty different terpenes and terpene derivatives (1.8 cineol, camphor, linalool, tujone, 4-terpineol, borneol, α -Cardinol), artemisia ketone, flavonoids, políinos, numerous coumarins and sesquiterpene lactones (artemisinin artemisinic acid arteanuina B, etc.). It was used as an anthelmintic, but has fallen into disuse because of its toxicity, adverse reactions such as allergies and abortive activity [20].

Its use as an antimalarial in cases of severe falciparum malaria in situation of resistance to other antimalarials [22].

In conclusion, Artemis has a very old reputation as an anthelmintic [23]. All Artemis species contain thuyona Artemisia essential oil which is somewhat toxic. Because of this, these plants should not been used in high doses, since it can cause dizziness, headache, convulsions, hallucinations, addiction, tremors, nausea and vomiting [21].

The Asclepia popularly known as "Spanish Banderita or Spanish Flag" belongs to the family of Asclepiadaceae. The whole plant is considered toxic (Ed. FA VIII) and its milky juice is caustic. However it is recorded in ethnomedicine that this specie has anti-parasitic (with leaf infusion), insecticidal and anthelmintic actions (diluted latex). In Aldama, México few drops of milky juice in 500ml of water are consume throughout the day [24] as anthelmintic and also for cardiac stimulation –since it has glucoside action- [25, 26].

The root *Atractylis gummifera* L. popularly known as "League" in the family of Asteraceae is classified as toxic plant drug (FA VIII Ed.) but records shows that mixed with food acts as a repellent and insecticide for bug and external parasites. The mechanism of action is explained because the composition contains atractyloside (ATR) and carboxiatractiloside, two diterpene heterosides that cause inhibition of the respiratory chain at the cellular level (C Hamouda, 2004). The toxic effect arises from ATR, a potent inhibitor of oxidative phosphorylation in mitochondria [27].

The essence oil *Castile erecta* ssp popularly known as "Bizbirinda", "bitter squat" belonging to the family of Lorantaceae destroys parasites in adulthood and its cyst form in the intestinal mucosa [28].

The leaves and fruit of *Chenopodium ambrosioides* L. popularly known as "Goosefoot", "Piako", "paico", belonging to the family of Amaranthaceae, is considered vermifuge since the oil obtained from the whole plant is toxic for parasites (FA VIII Ed.) *Chenopodium* oil is known as an effective anthelmintic due to its contents of ascaridol. Although it is widely used, however, the application is not easy since it must be followed by a treatment with a laxative, immediately after ingestion.

Infusion and decoction for internal is used as an external antiparasitic and anthelmintic and it is also use in topical applications as antiparasitic and scabicide. Dry powder and seeds are used against parasites, hookworms and tapeworms, and on the floor like flea [28].

In a rural community in Huaraz, Peru, a clinical essay with 60 children, aged 3 to 14 years old, was performed dividing these patients in a randomized way into two groups of treatment Albendazole and Paico (n = 30 each group). All the patients were initially evaluated as positively for *Áscaris lumbricoides* in stool. Treatment consisted of Paico juice: 1 ml / kg for children less than 10 kg, 2 ml / kg dose for 3 consecutive days. Administration of Albendazole was a done by a single dose of 400 mg in children over 5 years and 200 mg in young adults. The main objective

parameter was the complete disappearance of *Ascaris* eggs and additional quantitative parameter was reduced parasite load.

The research was performed in the laboratory of the Regional Health Directorate of Ancash. Eradication rates for *Ascaris* with Albendazole or Paico were both about 86%. Quantitative effectiveness was 59.5% and 58.3% for Paico and Albendazole respectively. The authors conclude that Paico have similar efficacy that Albendazole against *Ascaris lumbricoides*. Paico also had the added benefit of being effective against *Hymenolepis nana* [29].

Another study of leaf extracts in two villages near Tarapoto, San Martin, Peru included 72 patients with intestinal parasitic infections. Status was examined before and after 8 days after ingestion, confirming 100% of the efficacy against *Ancylostoma* and *Trichuris* and 50% against *Ascaris*. There were no significant differences in age or sex [30].

The root bark and trunk of *Cinchona* spp, popularly known as "Quina" belonging to the family of Rubiaceae, has antimalarial activity, since it is rich in phenolic compounds including you cinconaines; proantocianidoles, quinic acid, saponins, alpha-terpineol, linalool, limonene, terpenes [31,32]. Anti-malarial activity of quinine was demonstrated either for treatment and prophylaxis of *Plasmodium vivax* malarías, *P. falciparum*, *P. ovale* and *P. malarie* and inactivation of sporozoites and tissue forms [23].

The leaves and stems of *Combretum micranthum* L popularly known as "Combretum" belonging to the family of Combretaceae; contains alkaloids, betaine derivatives, as staquidrine, 4-hydroxistaquidrine, combretine-A; flavones as vitexin, saponarettine, orientin and tannins catechic. Activity against parasite referred to its alkaloids compounds but results are limited [7, 33].

Seeds of *Cucurbita* popularly known as "Pumpkin" belonging to the family of Cucurbitaceae is active against *Taenia* spp, *Hymenolepis* spp, *Enterobius* spp, *Ascaris* spp, [11, 18, 21]. This action is due to the cucurbitine which is active in trematodes, but inactive against nematodes and cestodos. The advantage this family is that it has no hepatic and gastrointestinal toxicity [32]. Formulation could be prepare as follows: 60 g of crushed seeds, 40 g of sugar, 60 mL of water, boiled for 20 min, mixing and emulsifying unstrained. Patients should take 1 portion daily [18].

The seeds of *Delphinium staphisagria* L. popularly known as "Estafisgria", or "Kill lice", belonging to the family of Ranunculaceae, demonstrated antiparasitic action, specially active against pediculosis, scabies and Chagas disease [7,34]. Since it contains (toxic) alkaloids, it is recommend to use is as external plant powder as environment repellent.

From dried flower of *Eugenia caryophyllus* popularly known as "Nail" belonging to the family of Myrtaceae, it can be obtained an essential oil that showed acaricidal activity against *Dermatophagoides farinae* and *D. pteronyssinus* eugenol, *Psoroptes cuniculi*. Dried flowers ground cloves (*Eugenia caryophyllus*) are also prepared as a tea infusion with 4 g of powdered herb per 250 ml of boiling water. This should be soaked for 10-20 min, cooled and strained. The dose used was 15 ml per day per 11 kg of body weight for 2-3 days. Oil from this plant is not considered safe for pets [12]. *Eugenia caryophyllus* may contribute to parasitide action either alone or in combination. Alpha-thujone, the active ingredient of wormwood oil, was reported with insecticide and anti-helminthic activity [35]. The eugenol and caryophyllene in *Eugenia caryophyllata* are also informed as anti-helminthic compounds [36,37,38].

The whole plant of *Eugenia uniflora* popularly known as "ñangapiry pitanga" belongs to the family of Myrtaceae, and is found in the tropical jungles of Argentina, Brazil, Paraguay, southern Mexico and Paraguay. It is used in the Guaraní communities for their antihelminthic properties [39,40,41]. The plant contains lycopene composition, terpene compounds, oxalic acid, chlorogenic acid, pitagina, cineol, beta carotenes and citric acid [41,42].

The root of *Inula helenium* L. rhizome popularly known as "Elecampane, grass moro" belongs to the family of Asteraceae and has an intestinal antiparasitic properties. Sequiterpenes found in its composition, triterpene alcohols, inulin, helenina, azulene, sterols, fructans and mucilages, essential oil (*Enula camphor*) [7,43] are the basis of its vermifuge action. Decoction of the roots and

rhizomes, ointment extracts, powdered drug and essential oil obtained by distillation are all formulations used in traditional medicine.

The dried leaves of *Juglans regia* popularly known as "Walnut" belonging to the family of Asteraceae, originally from Persia and cultivated in North-West of Argentina have demonstrated anthelmintic activity against *Haemonchus contortus* in goats. Juglone, and naphthoquinone are the compounds of this family reported with anthelmintic activity [7, 11, 12, 32]. It exist research data demonstrating that decoction and crushing and soaking water of this plant is useful as insect repellent [21].

The flowering tops *Matricaria chamomilla* popularly known as "Manzanilla" belongs to the family of Asteraceae. In infusion the plant only released 10 to 15% of the total content of essential oils. This oil is mainly composed of sesquiterpenes (azulene), and bisaboloides (camazulen-bisabolol). On the other hand, water-soluble portion contains flavonoiglicosides, terpene, pectins and various oligosaccharides compounds.

It is considered as FA official drug, but its indication does not refer to the antiparasitic property, however, in Argentina it is use as an anti-helmintic agent. Some authors refer their activity mainly due to its flavonoids (apigenin and luteolin). [32,40].

The essential oil obtained from the leaves and dried flowering tops of *Mentha piperita* popularly known as "Mint" belongs to the family of Lamiaceae. It has the property to remove worms and other parasites from the digestive tract, hence the Spanish proverb "jury is mint, never lie to the stomach" is based in this herb's action. Also is used for environmental repellent in ways bunches. The leaves contain essential oil (menthol, menthone, methyl acetate, mentafurane, isomenthone, pulegone, piperitone, cineol, limonene), flavonoids (apigenol, luteol, rutoside, mentosido), phenolic acids (caffeic, chlorogenic, rosmarinic), tannins and triterpenes (ursolic acid, oleanilic acid) [12,32]. *Mentha cordifolia* contains beta-sitosterol glycosides and has been tested against *Ascaris suum* showing a similar synthetic anthelmintic mebendazole on contact with the preparations of the parasite activity. Mint spp., has also been tested with succeed against *Haemonchus contortus* in ruminant hosts [12].

Balsamum Myroxylon popularly known as "Balm of Peru" belonging to the family Fabaceae is considered by Drugs Official USP as parasiticide and anthelmintic drug. Its resin is used to mange, lice, mites [7].

The root of *Nephrodium* popularly known as "male fern" belonging to the family of Polypodiaceae, is used for treatment against tapeworm. It is suggested to take either 1 capsule or drink an extract every 10 minute one hour after taking a saline purgative. It is not recommended in children, elderly, or patients suffering from kidney's disease [11].

Leaves of *Nicotiana glauca* Graham popularly known as "Palán-Palán" belonging to the family Solanaceae, is well known for its toxicity property due to anabasine, an alkaloid used for nicotine addiction treatment. It also contains piperidine, nicotine, nornicotine, citric, succinic, malic and oxalic acid. The family is considered an active ectoparasiticide and anthelmintic [42,44,45]. The dried leaves of *Nicotiana tabacum* "snuff" belonging to the family Solanaceae, is considered toxic (Ed. FA VIII) and only is permitted for external use. It is used as ectoparasiticide in the form of nicotine salicylate (eudermol) or sulfate. It has also demonstrated to be useful for helminthiasis [25, 46], however its toxicity limits this last indication. The external use of this plant includes treatment for scabies [47] and leeches [12, 48].

The leaves, twigs, rhizomes of *Podophyllum peltatum* L "podophyllum" belonging to the family of Berberidaceae is allowed only for external use [7], however in Argentina it is also use an anthelmintic (anti-worm) [49] since resin contains lignans [podophyllotoxin picropodophyllin, peltatin alpha-, beta-peltatin] heterosides glucosidices. It is well recognized in pediatric medicine as drug useful in digestive disorders. Its conservation is difficult because it's essential oil content decreases by 1% per month.

The root bark and occasionally the trunk and the fruits of *Punica granatum* L known as "Granado" belonging to the family Lythraceae has demonstrate action against tenias (accompanied

by a purgative to induce expulsion of tapeworm) [11]. The decoction of the root bark is the best way to obtain useful formulations [7]. Its use was recommended for 15 centuries as an anthelmintic (especially as taenicide). It contains alkaloids (pelletierine, isopeletierina, pseudopeletierine, N-metilpeletierina) hydrolysable tannins (3,6-hexahidrofenoilglucosa, granatinas A and B, punicafolina, puniacorteínas A, B and C, punigluconina, punicalin, punicalagin). The harmful effects due to the fraction absorbed in the intestine, have led to quit its use and its indication rest for veterinary use. [11].

The flowering tops, stems, leaves and flowers of *Deruta graveolens* when extract and distilled in pot stills to steam, is known as "Ruda" (belonging to the family of Rutaceae) which gives an essential oil that has a light attributed to ketone nonylmethyl anthelmintic effect. Its odor inhibits the fifth instar *Rhodnius prolixus* of triatomines. That is why it is classified with a medium level validity as an anthelmintic [12, 50] and because of that is suggested to associate this herb with the paico and wormwood for intestinal worms [11].

Leaf infusion of young branches of *Santolina chamaecyparissus* popularly known as "stranded Abrotano" belonging to the family of Asteraceae; is used to repel aphids [7]. However, it is also used as an anti-helmintic in order to eliminate intestinal parasites in children.

The flowering tops *Senecio jacobaea* L. popularly known as "ragwort tansy" belonging to the family of alkaloids piriolidirices Asteraceae, contains essential oil with metilheptilcetona-pinene, cineole, l-limonene and minor amounts of methyl-n-nonilcarbinol) which gives the properties of vermicides [7,51].

Tanacetum cinararifolium popularly known as "Pyrethrum" belonging to the family Asteraceae is use as insecticide [7,26] and to eliminate parasites of pets [32].

The flowering tops of *Tanacetum vulgare* popularly known as "tansy tansy" also belongs to the family of Asteraceae and has anti-helmintic properties (oil), worming and threadworm (branches, flowers and seeds) [7,11,40]. *Tanacetum vulgare* is prohibited for free sale to the public, because of its toxicity. Its use is restricted to the manufacture of pharmaceutical specialties, master formulas, officinal preparations, homeopathic stocks and research studies.

Young branches of *Thuja occidentalis* L. popularly known as "Yours" belonging to the family of Cupressaceae has anthelmintic [7] and insecticide activity [35, 52]. This property can refer to the contents of Alpha-thujone.

The oil obtained from the leaves and flowering tops of *Thymus vulgaris* L. popularly known as "Thyme" belonging to the family of Lamiaceae, contains thymol, phenol, cimol, l-alpha pinene, beta pinene, camphene, terpinene, geraniol and caryophyllene; and it is indicated for intestinal worms. However, its use is limited because its hepatic toxicity, albuminuria, hematuria, allergic reactions and seizures (due to high doses of thymol) [7, 53].

Leaves and stems of *Verbena officinalis* L. popularly known as "Verbena" belonging to the family Verbenaceae, has poor information about worming activity except for *Ascaris* [54]. European Commission believes that the plant cannot be recommended in therapeutics use since none of its indications have been justified with clinical studies or trials are also its side effects and toxicity are still unknown [11].

Conclusions

There are many plants found along Argentine territory that are not yet been well studied. That's why this work becomes interest in order to validate them as a tool for wormers control based on scientific publications.

Herbs have been used for centuries against endoparasitocides. The regulatory agencies (FDA, ANMAT) regulated some of the plants presented in our research like *Artemisia absinthium*, black walnut nut, and wormwood as useful herbs with vermicide action.

Since synthetic drugs have usually undesirably impact on the biology of our ecosystems and have also a residual effect on humans that ends in overall resistance to pesticides; plants species should be considered as alternatives to conventional chemical drugs anti-parasitic treatment.
