ABSTRACT

A series containing thirteen title compounds were synthesized and recorded IR and NMR spectra. The infrared νNH, C=N (cm⁻¹) stretches, ¹H NMR δNH, ¹³C NMR δC=N (ppm) chemical shifts of synthesized oxazine amines were assigned and correlated with Hammett substituent constants, F and R parameters. From the results of statistical analyses, the effect of substituents on the above spectral frequencies can be discussed.

Keywords: Oxazine-2-amines; IR spectra; NMR spectra; Hammett correlation; Substituent constants

1. INTRODUCTION

Spectroscopic data are useful for ground state equilibration of organic compounds [1]. From the infrared spectral frequencies E s-cis and s-trans conformers of styrenes [2], polyenes [3], chalcones [4], unsaturated aldehydes [5], acid chlorides [6], unsaturated esters [7], gauche and anti- form acyl halides and its esters [8]. Nuclear magnetic resonance spectral chemical shifts was used for prediction of the spatial arrangement of protons such as cis and trans of organic stereo chemical compounds [9]. Now-a-days chemists and spectroscopic researchers [10-15] have paid much more interest for correlation of spectral data with Hammett substituent constants. Thirunarayanan and Ravi [15] have synthesized and studied the effect of substituents of some pyrazoline-1-ethanones. Substituent effects on the spectral group frequencies of 9H-fluorenayl bromides were investigated by Thirunarayanan [16]. Sakthinathan et al., have studied the effect of substituents on naphthyl based pyrazoline derivatives [17]. Sasikala et al., [18] have investigated the effect of substituents and antimicrobial activities of some 5-bromo-2-thienyl based pyrazolines. The spectral correlation of infrared and nuclear magnetic resonance spectra of E-imines have been studied by Sakthinathan et. al. and Suresh et al., [19,20]. Thirunarayanan and Sekar have studied the substituent effects on the IR and NMR spectral frequencies of some 3-(3,4-dichlorophenyl)-pyrazoline carbothioimides [21]. Spectral correlation study was first studied on the Trogers bases by Thirunarayanan [22]. Recently, Janaki et al., Vanangamudi et al., Subramanian et al. and Thirunarayanan et al., [23-26,29-32] have been studied the effects of substituents on the spectral data of various chalcones. Within the above view, there is no report available for the study of spectral correlation analysis on 4-(6-methoxy-2-naphthyl)-5,6-dihydro-6(substituted...
phenyl)-4H-1,3-oxazine-2-amines. Therefore the author have taken effort to synthesis and recorded the IR and NMR spectra for studying spectral correlation of above title compounds.

2. EXPERIMENTAL

2.1. General
All chemicals and solvents used in this present study were procured from Sigma-Aldrich and Merck companies. The infrared spectra of all oxazine imines have been recorded in SHIMADUZ Fourier Transform IR spectrophotometer using KBr disc. The NMR spectra of all compounds were recorded in BRUKER AV 400 type spectrometer, Using CDCl₃ as a solvent, 400 MHz frequency was applied for recording ¹H, 100 MHz for ¹³C NMR spectra, taking TMS as standard.

2.2. Synthesis of 4-(6-methoxy-2-naphthyl)-5,6-dihydro-6(substituted phenyl)-4H-1,3-oxazine-2-amines [27]

The title oxazine-2-amines were synthesized and their purities were checked by literature method.

3. RESULTS AND DISCUSSION

In the present study, the author have investigated the effect of substituents on the infrared νNH, C=N (cm⁻¹) stretches, ¹H NMR δNH, ¹³C NMR δC=N (ppm) chemical shifts of 4-(6-methoxy-2-naphthyl)-5,6-dihydro-6(substituted phenyl)-4H-1,3-oxazine-2-amines by Hammett correlation (Table 1).

3. 1. Infrared spectral study

In infrared spectral study, the νNH, C=N (cm⁻¹) stretches of synthesized amines were correlated by the Hammett equation as shown in equation (1).

\[ \nu = \rho \sigma + \nu_o \]  

where \( \nu_o \) is the frequency for the parent member of the series.

The assigned νNH, C=N (cm⁻¹) stretches, \(^1\)H NMR δNH, \(^{13}\)C NMR δC=N (ppm) chemical shifts of 4-(6-methoxy-2-naphthyl)-5,6-dihydro-6-(substituted phenyl)-\(^4\)H-1,3-oxazine-2-amines were presented in Table 1. These data were correlated with Hammett substituent constants, F and R parameters excluding H, 3-NH₂, 4-(N(CH₃)₂), 4-OH and 4-CH₃ substituents. When these substituents were included in the correlation, the correlation was reduced considerably. All correlations gave positive ρ values. This implies that the normal substituent effects operates in all systems.

The correlation of infrared νNH (cm⁻¹) stretches of 4-(6-methoxy-2-naphthyl)-5,6-dihydro-6-(substituted phenyl)-\(^4\)H-1,3-oxazine-2-amines were satisfactorily with Hammett substituent constants, F and R parameters excluding H, 3-Cl, 4-N(CH₃)₂, 4-OH, 4-OCH₃ and 4-CH₃ substituents. When these substituents were included in the correlation, the correlation was reduced considerably. All correlations gave positive ρ values. This implies that the normal substituent effects operates in all systems.

The correlation of infrared νCN (cm⁻¹) stretches of 4-(6-methoxy-2-naphthyl)-5,6-dihydro-6-(substituted phenyl)-\(^4\)H-1,3-oxazine-2-amines were satisfactorily with Hammett substituent constants, F and R parameters excluding H, 3-Cl, 4-N(CH₃)₂, 4-OH, 4-OCH₃ and 4-CH₃ substituents. When these substituents were included in the correlation, the correlation was reduced considerably. All correlations gave positive ρ values. This implies that the normal substituent effects operates in all systems.

Table 2. Results of statistical analysis of infrared νNH, C=N, \(^1\)H NMR δNH, \(^{13}\)C NMR of δC=N (ppm) of 4-(6-methoxy-2-naphthyl)-5,6-dihydro-6-(substituted phenyl)-\(^4\)H-1,3-oxazine-2-amines derivatives with Hammett substituent constants σ, σ', σᵣ, F and R parameters.

$r =$ correlation co-efficient; $\rho =$ slope; $I =$ intercept; $s =$ standard deviation; $n =$ number of substituents

Similarly the multi-functional regression analysis of these stretches shows satisfactory correlation with $\sigma_I$ and $\sigma_R$ or F and R Swain-Lupton [28] parameters. The generated multi-regression analysis equations are given in (2-5)

\[
v_{\text{NH}}(\text{cm}^{-1}) = 3549.99(\pm4.373) + 1.699(\pm0.873)\sigma_I + 21.282(\pm8.533)\sigma_R \quad \text{(2)}
\]

\[
R = 0.973, n = 13, P > 95 \%
\]

\[
v_{\text{NH}}(\text{cm}^{-1}) = 3547.38(\pm4.788) + 7.430(\pm0.948)F + 10.961(\pm6.007)R \quad \text{(3)}
\]

\[
R = 0.967, n = 13, P > 95 \%
\]

\[
v_{\text{CN}}(\text{cm}^{-1}) = 1608.41(\pm11.357) + 13.998(\pm2.268)\sigma_I + 19.509(\pm2.192)\sigma_R \quad \text{(4)}
\]

\[
R = 0.948, n = 13, P > 90 \%
\]

\[
v_{\text{CN}}(\text{cm}^{-1}) = 1606.25(\pm11.443) + 19.713(\pm2.262)F + 11359(\pm1.435)R \quad \text{(5)}
\]

\[
R = 0.950, n = 13, P > 95 \%
\]

3. 2. NMR spectral study

$^1$H NMR spectral study

In nuclear magnetic resonance spectra, the $^1$H or the $^{13}$C chemical shifts (δ) (ppm) depend on the electronic environment of the nuclei concerned. These chemical shifts have been correlated with reactivity parameters. Thus the Hammett equation may be used in the form as shown in (6).

\[
\log \delta = \log \delta_0 + \rho \sigma \quad \text{(6)}
\]

where $\delta_0$ is the chemical shift of the corresponding parent compound.
The assigned $^1$H NMR $\delta_{\text{NH}}$, $^{13}$C NMR $\delta_{\text{C}=\text{N}}$ (ppm) chemical shifts of 4-(6-methoxy-2-naphthyl)-5,6-dihydro-6-(substituted phenyl)$^4\text{H}$-1,3-oxazine-2-amines were presented in Table 1. These data were correlated with Hammett substituent constants, F and R parameters linear regression analysis. The result of statistical analysis was presented in Table 2. From Table 2, the $\delta_{\text{NH}}$ (ppm) chemical shifts of 4-(6-methoxy-2-naphthyl)-5,6-dihydro-6-(substituted phenyl)$^4\text{H}$-1,3-oxazine-2-amines were satisfactorily correlated with Hammett substituent constants, F and R parameters excluding H, 4-OH, 4-OCH$_3$, 4-CH$_3$, 2-NO$_2$, 3-NO$_2$ and 4-NO$_2$ substituents. If these substituents were accomplished with regression, they reduced the regression coefficient considerably. All correlations gave positive $\rho$ values. This means that then normal substituent effects operates in all systems.

![Resonance-Conjugative Structure](image)

**Fig. 1.** The resonance-conjugative structure.

From Table 2, the $^{13}$C NMR $\delta_{\text{C}=\text{N}}$ (ppm) chemical shifts of 4-(6-methoxy-2-naphthyl)-5,6-dihydro-6-(substituted phenyl)$^4\text{H}$-1,3-oxazine-2-amines were satisfactorily correlated with Hammett $\sigma$, $\sigma^+$, $\sigma_R$ substituent constants and R parameters excluding H, 3-NH$_2$, 3-Br, 4-OH, 2-NO$_2$, 3-NO$_2$ and 4-NO$_2$ substituents. If these substituents were accomplished with regression, they reduced the regression coefficient considerably. The Hammett $\sigma_1$ constant and F parameter were fail in correlation. This is due to the inability of substituent constants for prediction of reactivity on the chemical shifts of oxazine amines and associated with resonance conjugative structure shown in Fig. 1. All correlations gave positive $\rho$ values. This means that then normal substituent effects operates in all systems.

In view of the inability of prediction of effect of substituents by single regression analysis with Hammett substituent constants, F and R parameters, they are worthwhile when seeking in multi-regression analysis for $^1$H NMR $\delta_{\text{NH}}$, $^{13}$C NMR $\delta_{\text{C}=\text{N}}$ (ppm) chemical shifts of 4-(6-methoxy-2-naphthyl)-5,6-dihydro-6-(substituted phenyl)$^4\text{H}$-1,3-oxazine-2-amines. The generated multi-regression analysis equations are given in (7-10)

\[
\delta_{\text{NH}}(\text{ppm}) = 2.231(\pm 0.054) + 0.013(\pm 0.001)\sigma_1 + 0.216(\pm 0.090)\sigma_R \quad \ldots (7)
\]

\[R = 0.968, \ n = 13, \ P > 95 \%\]

\[
\delta_{\text{NH}}(\text{ppm}) = 2.221(\pm 0.051) + 0.042(\pm 0.012)F + 0.135(\pm 0.061)R \quad \ldots (8)
\]

\[R = 0.967, \ n = 13, \ P > 95 \%\]
\[ \delta_{\text{CN}}(\text{ppm}) = 165.39(\pm0.377) -0.332(\pm0.075)\sigma_I + 0.563(\pm0.072)\sigma_R \] 
\[ (R = 0.923, n = 13, P > 90 \%) \] 
\[ \delta_{\text{CN}}(\text{ppm}) = 165.33(\pm0.390) - 0.211(\pm0.077)F + 0.267(\pm0.049)R \] 
\[ (R = 0.917, n = 13, P > 90 \%) \] 

4. CONCLUSIONS

Totally thirteen 4-(6-methoxy-2-naphthyl)-5,6-dihydro-6-(substituted phenyl)-4H-1,3-oxazine-2-amine compounds were synthesized and recorded IR and NMR spectra. The infrared νNH, C=N (cm\(^{-1}\)) stretches, \(^1\)H NMR δNH, \(^{13}\)C NMR δC=N (ppm) chemical shifts of synthesized oxazine amines were assigned and correlated with Hammett substituent constants, F and R parameters. From the single parameter correlation analyses, the infrared νNH, C=N (cm\(^{-1}\)) stretches and \(^1\)H NMR δNH (ppm) chemical shifts correlated satisfactorily with Hammett substituent constants, F and R parameters. The \(^{13}\)C NMR δC=N (ppm) chemical shifts of synthesized amines All the above spectral frequencies were satisfactorily correlated with σ\(_I\) and σ\(_R\) or F and R Swain-Lupton parameters in multi-regression analysis.

ACKNOWLEDGEMENT

The author thank DST- NMR Facility, Department of Chemistry, Annamalai University, Annamalainagar-608002 for recording NMR spectra of compounds.
