ABSTRACT

Heterocyclic derivatives such as phenyl pyrazolines and isoxazoles were prepared from s-triazine based chalcones. Chalcones (A1 - A5) are synthesised by the reaction of compound (V) with various aromatic aldehydes. Moreover, further reaction of chalcones with phenyl hydrazine hydrochloride and hydroxylamine hydrochloride in the presence of alkali gives phenyl pyrazolines (A6 - A10) and isoxazoles (A11 - A15) derivatives respectively. The structures of the newly synthesised compounds were confirmed by spectroscopic (IR, 1H NMR, 13C NMR) and elemental analysis. All the newly synthesised compounds have been screened for their antimicrobial activity against selected Gram - positive (S. aureus and S. pyogenus), Gram - negative (E. coli and P. aeruginosa) bacterial and fungal strains (C. albicans, A. niger and A. clavatus).

Keywords: Chalcones; phenyl pyrazolines; isoxazoles; spectral data; elemental analysis; antimicrobial activity

1. INTRODUCTION

The main fears for human beings are a variety of diseases. Scientists and doctors are still struggling to find solutions with various forms of medications. Today’s new medicines are results of inexorable effort made by human civilization time to time. The most common compounds of chalconoid group are the chalcones, which provide new class of medicines due to the pharmacologically active moiety and various biological activities. The chalcones are 1, 3 - diarylprop - 2 - en - 1 - one, form a broad class of compounds containing two aromatic rings bound with vinyl ketone fragment. Chalcones are useful intermediates for obtaining the variety of heterocycles [1-5]. Various chalcone derivatives are remarkable materials for their second harmonic generation [6]. They are naturally occurring plant metabolites possess a broad spectrum of biological activities such as cancer cell lines [7-8], antimitotic [9], anti-inflammatory [10], hepatoprotective [11], molluscicidal properties [12], heme oxygenase-1 [13], antimicrobial [14] etc... So, this broad spectrum of applications encouraged us to search for another addition to the existed molecule.
Pyrazoline derivatives with a phenyl group at 5-position show good film-forming properties, excellent features of blue photoluminescence and electroluminescence [15]. Pyrazoline derivatives have a long history of application in agrochemicals and pharmaceutical industry as herbicides and active pharmaceuticals. Nowadays, a major portion of research in heterocyclic chemistry has been devoted to 2-pyrazolines containing diverse aryl groups as substituents. Pyrazoline derivatives are well known for their different biological activities such as antifeedant [16], anti-inflammatory [17], antiviral [18], antidepressant [19], antibacterial [20], antifungal [21] etc... Many class of chemotherapeutic agents containing pyrazoline nucleus are in clinical use such as orisul (antibacterial), antipyrine (antipyretic), butazolidine (anti-inflammatory). So based on the above biological activities exhibited by the pyrazoline compounds, we reported here, the synthesis and biological screening of some novel phenyl pyrazoline derivatives.

Among heterocycles, the isoxazole unit constitutes an easily accessible nucleus that is present in a number of natural and pharmacological compounds [22], display a wide range of organic reactivities and used as an effective means of preparing new molecular scaffolds [23]. Isoxazoles have been repeatedly shown as useful synthons in organic synthesis [24]. Isoxazoles shows a broad spectrum of biological properties like fungicidal [25], antimicrobial [26], antitubercular [27], antiviral [28] etc... So in this regard, we have synthesised some novel isoxazole derivatives and screened this compounds to antimicrobial activity.

2. EXPERIMENTAL

2.1. Material

All the chemicals and solvents which used for reaction were purified after getting from commercial suppliers. Melting points were taken in open capillaries using paraffin bath and were uncorrected. IR spectra were recorded on Shimadzu IR Affinity - 1 FTIR spectrometer (V_max -1), $^1$H NMR were recorded on Bruker Avance - DPX 400 MHz NMR spectrometer using CDCl$_3$ as a solvent and TMS as internal reference and $^{13}$C NMR spectra were recorded on the same instrument at 100 MHz operating frequency using DMSO as a solvent and TMS as internal reference. The chemical shifts are expressed in parts per million (ppm) downfield from the internal standard and signals are quoted as s (singlet), d (doublet) and m (multiplet). The coupling constants ($J$) are given in Hertz (Hz). All the compounds were analyzed for carbon, hydrogen and nitrogen by the Perkin-Elmer 240 C H N elemental analyzer and the results were within ±0.4% of theoretical values. The purity of synthesised compounds were checked by thin layer chromatography conducted on Silica Gel 60 F-254 (Merck) plates of 0.25 mm thickness and the spots were located using toluene : methanol (12 : 6 v/v) eluents and visualized with UV (254 nm) light or keeping the plates in iodine chamber.

2.2. Method

2.2.1. General procedure for the compounds (III), (IV) and (V)

Compounds (III), (IV) and (V) were prepared by the reported method [29].
2.2.B. Preparation of 2\-(3'\,- trifluoromethylphenylamino\) - 4\- (tetrahydro - 1', 4' - oxazine) - 6\- [4'\- \{3''\- (4'''\- methoxyphenyl) - 2''\- propenon - 1''\- yl\}\ phenylamino\] - s\- triazine (A\textsubscript{1})

In a round-bottomed flask, substituted acetophenone (V) (0.01 mol, 4.5g in 20 ml DMF) was dissolved in a dimethyl formamide and 4\- methoxybenzaldehyde (0.01 mol, 1.36g in 10 ml DMF) was added in it. To make this mixture alkaline 40\% KOH(5 ml) was added as catalyst, then the reaction mixture was stirred for 24 hours at room temperature. The progress of reaction was monitored by TLC. After completion of the reaction, the reaction mixture was poured into crushed ice and neutralise with HCl. Finally, the product was filtered, dried and purified by recrystallization from ethanol. In the same way, the remaining compounds (A\textsubscript{2} - A\textsubscript{5}) were prepared by this method. All the synthesised compounds (A\textsubscript{1} - A\textsubscript{5}) were characterised by IR, \textsuperscript{1}H NMR, \textsuperscript{13}C NMR spectroscopy, the characteristic data of the entire synthesised compounds are given in spectral analysis data (3) and physical data are given in Table - 1.

2.2.C. 2\- (3'\,- trifluoromethylphenylamino\) - 4\- (tetrahydro - 1', 4' - oxazine) - 6\- [4'\- \{1''\- phenyl 5''\- (4'''\- methoxyphenyl) 2''\- pyrazolin 3''\- yl\}\ phenylamino\] - s\- triazine (A\textsubscript{6})

chalcone (A\textsubscript{1}) (0.01 mol, 5.76g in 30 ml alcohol) and phenyl hydrazine hydrochloride (0.01mol, 1.44 g in 10 ml alcohol) was dissolved in alcohol. To make this mixture alkaline 40\% KOH (5 ml) was added to the reaction mixture and refluxed for 8 hours. The progress of the reaction was monitored by using TLC. After completion of the reaction, the reaction mixture was poured into crushed ice and neutralise with dilute HCl. Finally, the product was filtered, washed with water, dried and recrystallization from ethanol to get product (A\textsubscript{6}) in good yield with high purity. In the same way other remaining compounds (A\textsubscript{7} - A\textsubscript{10}) were prepared by this method. All the synthesised compounds (A\textsubscript{6} - A\textsubscript{10}) were characterised by IR, \textsuperscript{1}H NMR, \textsuperscript{13}C NMR spectroscopy, the characteristic data of the entire synthesised compounds are given in spectral analysis data (3) and physical data are given in Table - 1.

2.2.D. Preparation of 2\- (3'\,- trifluoromethylphenylamino\) - 4\- (tetrahydro - 1', 4' - oxazine) - 6\- [4'\- \{5''\- (4'''\- methoxyphenyl) 2''\- isoazol - 3''\- yl\}\ phenylamino\] - s\- triazine (A\textsubscript{11})

Compound (A\textsubscript{1}) (0.01 mol, 5.76g in 30 ml alcohol) and hydroxylamine hydrochloride (0.01mol, 0.695g in 10 ml alcohol) was dissolved in methanol. To make this mixture alkaline 40\% KOH (5 ml) was added to the reaction mixture and refluxed for 8 hours. The progress of the reaction was monitored by using TLC. After completion of the reaction, the reaction mixture was poured into crushed ice and neutralised with dilute HCl. Finally, the product was filtered, washed with water, dried and recrystallization from ethanol to get product (A\textsubscript{11}) in good yield with high purity. In the same way other remaining compounds (A\textsubscript{12} - A\textsubscript{15}) were prepared by this method. All the synthesised compounds (A\textsubscript{12} - A\textsubscript{15}) were characterised by IR, \textsuperscript{1}H NMR, \textsuperscript{13}C NMR spectroscopy, the characteristic data of the entire synthesised compounds are given in spectral analysis data (3) and physical data are given in Table - 1.

- 2 (3''- trifluromethylphenylamino) - 4 (tetrahydro - 1', 4''- oxazine)

- 6 [4''- {5''- (4''- chlorophenyl) 2''- isoaxozol 3''- yl} phenylamino] - s - triazine : IR (KBr) cm$^{-1}$ : 3373 (-NH), 3019 (=CH str.), 815 (C-H bending), 1645 (C=N str., isoxazolomeiety), 1249 (C-O- C), 1066 (C- F), 661 (C- Cl). $^1$H NMR (δ ppm, CDCl$_3$) : 3.47 (t, 8H, -CH$_2$, oxazine ring), 6.56 (1H, s, -CH=), 6.9 to 8.2 (m, 13H, 12 Ar-H and1-NH). $^{13}$C NMR (δ ppm, DMSO) : 48.0, 66.8, 98.6, 112.1, 114.8, 120.6, 122.5, 123.7, 125.8, 127.9, 132.2, 133.8, 138.2, 142.9, 164.1, 166.3, 169.4, 173.2, 176.0.

**Compound $A_4$:**
- 2 (3''- trifluromethylphenylamino) - 4 (tetrahydro - 1', 4''- oxazine)

- 6 [4''- {5''- (3''- phenoxphenyl) 2''- isoaxozol 3''- yl} phenylamino] - s - triazine : IR (KBr) cm$^{-1}$ : 3390 (-NH), 3080 (=CH str.), 843 (C-H bending), 1640 (C=N str., isoxazolomeiety), 1250 (C-O- C), 1049 (C- F). $^1$H NMR (δ ppm, CDCl$_3$) : 3.72 (t, 8H, -CH$_2$, oxazine ring), 6.45 (1H, s, -CH=), 6.7 to 8.3 (m, 18H, 17 Ar-H and1-NH). $^{13}$C NMR (δ ppm, DMSO) : 47.9, 67.2, 99.4, 110.2, 112.5, 118.3, 121.4, 122.8, 124.9, 127.0, 128.7, 132.1, 134.4, 137.2, 143.2, 156.7, 165.1, 168.8, 170.2, 171.5, 173.0.
**Compound A	extsubscript{15}**: 2 - (3'-trifluromethyphenylamino) - 4 - (tetrahydro - 1', 4' - oxazine) - 6 - [4' - {5''- (phenyl) 2'' - isoxazol - 3''- yl} phenylamino] - s - triazine : IR (KBr) cm	extsuperscript{-1} : 3356 (-NH), 3032 (=CH str.), 1608 (C=N str., isoxazole moiety), 1257 (C-O-C), 1067 (C-F). \( ^1 H \) NMR (\( \delta \) ppm, CDCl\( _3 \)) : 3.24 (t, 8H, -CH\(_2\) oxazine ring), 6.41 (1H, s, -CH=), 6.8 to 8.1 (m, 14H, 13 Ar-H and 1-NH). \( ^{13} C \) NMR (\( \delta \) ppm, DMSO) : 46.1, 66.3, 98.2, 112.5, 114.1, 120.3, 123.1, 125.8, 127.2, 129.0, 131.7, 133.2, 138.4, 142.8, 164.6, 166.4, 169.0, 172.7, 174.2.

### 4. RESULT AND DISCUSSION

#### 4.1. Antimicrobial evaluation

All the newly synthesised compounds were screened for antibacterial and antifungal activity by Broth dilution method [30] against a panel of selected Gram - positive (S. aureus MTCC 96 and Streptococcus pyogenes MTCC 442) and Gram - negative bacteria (E. coli MTCC 443 and P. aeruginosa MTCC 441) and selected fungal strains (C. albicans MTCC 227, A. niger MTCC 282 and A calavatus MTCC 1323). DMSO was used as a solvent. Ampicillin and Chloramphenicol was used as a standard drug for antibacterial activity while Greseofulvin and Nystatin was used as a standard drug for antifungal activity. The results are showed in Table - 2.

#### 4.1.A. Antibacterial Activity

From the screening results (Table-2), it has been observed that, In Gram positive bacterial strains compounds A\(_2\), A\(_5\), A\(_{15}\) (MIC =100 \( \mu \)g/ml) and A\(_8\), A\(_9\), A\(_{10}\) (MIC =125 \( \mu \)g/ml) exhibited excellent activity, compounds A\(_1\), A\(_3\), A\(_7\) and A\(_{11}\) (MIC =200 \( \mu \)g/ml) showed significant activity while compounds A\(_4\), A\(_6\), A\(_{12}\), A\(_{13}\) and A\(_{14}\) (MIC =250 \( \mu \)g/ml) exhibited equipotent activity against S. aureus (MTCC 96) compared to Ampicillin (MIC = 250 \( \mu \)g/ml). Compounds A\(_7\) and A\(_{10}\) (MIC =100 \( \mu \)g/ml) exhibited equipotent activity, whereas compounds A\(_2\), A\(_3\), A\(_4\), A\(_6\) and A\(_{14}\) (MIC =200 \( \mu \)g/ml) were moderately active against S. pyogenes (MTCC 442) compared to Ampicillin (MIC = 100 \( \mu \)g/ml). In Gram negative bacterial strains compound A\(_2\) (MIC = 62.5 \( \mu \)g/ml) exhibited excellent activity against E. coli (MTCC 443) compared to Ampicillin (MIC = 100 \( \mu \)g/ml) and modest to Chloramphenicol (MIC = 50 \( \mu \)g/ml) while compounds A\(_3\), A\(_7\), A\(_8\) (MIC = 100 \( \mu \)g/ml) and A\(_4\), A\(_5\), A\(_{12}\) and A\(_{14}\) (MIC = 125 \( \mu \)g/ml) showed equipotent activity against E. coli (MTCC 443) compared to Ampicillin (MIC = 100 \( \mu \)g/ml). Compound A\(_7\) (MIC = 62.5 \( \mu \)g/ml) exhibited excellent activity against P. aeruginosa (MTCC 441) compared to Ampicillin (MIC = 100 \( \mu \)g/ml) and comparable to Chloramphenicol (MIC = 50 \( \mu \)g/ml), whereas compounds A\(_4\), A\(_6\) (MIC = 100 \( \mu \)g/ml) and A\(_2\), A\(_{12}\) (MIC = 125 \( \mu \)g/ml) showed equipotent activity against P. Aeruginosa (MTCC 441) compared to Ampicillin (MIC = 100 \( \mu \)g/ml), while all other compounds were showed low to moderately active against all selected organisms.

#### 4.1.B. Antifungal Activity

From the screening results (Table-2), it has been observed that, compound A\(_2\) (MIC = 250 \( \mu \)g/ml) and A\(_7\) (MIC = 100 \( \mu \)g/ml) exhibited excellent activity against C. albicans (MTCC 227) compared to Greseofulvin (MIC = 500 \( \mu \)g/ml) and equipotent to Nystatin (MIC = 100 \( \mu \)g/ml).
μg/ml), while compounds A₁, A₅, A₆, A₁₀, A₁₂, A₁₃ and A₁₅ (MIC = 500 μg/ml) showed comparable activity against C. Albicans (MTCC 227) compared to Greseofulvin (MIC = 500 μg/ml). Compounds A₁ (MIC = 200 μg/ml) and A₂ (MIC = 100 μg/ml) exhibited equipotent activity against A. niger (MTCC 282) compared to Greseofulvin (MIC = 100 μg/ml) and Nystatin (MIC = 100 μg/ml). None of the compounds showed promising antifungal activity against A. clavatus (MTCC 1323).

5. CONCLUSION

In outline, we have synthesised some bioactive chalcones and convert them into pyrazoline and isoxazole moiety by using conventional method. The method adopted for the synthesis of pharmacologically important molecules in this investigation is simple, efficient, and inexpensive. The IR, ¹H NMR, ¹³C NMR spectral analysis and elemental analysis of all
the newly synthesised compounds confirmed that purity of the entire synthesised compound is good. All the synthesised compounds were screened for antimicrobial activity. Majority of the synthesised compounds were found to potentially active against both selected Gram positive, Gram negative organisms and selected fungal organisms. From the results of antibacterial and antifungal activity, it can be concluded that compounds A2, A7 and A12 were found more active than the remaining compounds due to the present of chlorine atom. So overall it was revealed that the no substitution on phenyl ring showed no inhibition of the tested bacteria while the compounds that showed some inhibition was due to the presence of substitution of methoxy, chloro, phenoxy and nitro group on some position of the phenyl ring. These finding concluded that the titled compounds have the properties to kill the microbes in some extent when compared with standard drug. These result suggest that chalcone and their derivatives have an opportunity to behave as broad spectrum antimicrobial agents and have excellent scope for further development as commercial antimicrobial agents.
